Skill Development

SCIB1102	CONSTRUCTION MATERIALS	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To introduce the various materials commonly used in civil engineering construction and their properties.
- To study the basics of concrete and Admixtures.
- To study the properties of modern construction materials used in construction.

UNIT 1 BUILDING MATERIALS

9 Hrs.

Soil - classification of soil - Stone - Tests on stones - Deterioration and Preservation of stone work - Bricks - Classification - Manufacturing of clay bricks - Tests on bricks - Refractory bricks - Fly Ash Bricks and Concrete blocks - Light weight blocks and panels.

UNIT 2 LIME CEMENT AGGREGATES MORTAR STEEL

9 Hrs.

Lime - Preparation of lime mortar - Cement - Ingredients - Manufacturing process - Types and Grades - Properties of cement and Cement mortar - Hydration - Test of Cements - Types of Cement- Aggregates - Testing of Aggregates - Mortar - classifications - properties of good mortar - uses of mortar - Manufacture of steel - properties and uses of different types of steel - mechanical and heat treatment of steel - Anticorrosive measures for steel.

UNIT 3 CONCRETE

9 Hrs.

Constituents of concrete (Cement and aggregate): Proportioning of concrete, water-cement ratio, Fresh concrete, Batching, Mixing, Transportation and placing, Compaction, Curing and finishes - Admixtures (Chemical, mineral) - RMC specifications.

UNIT 4 TIMBER AND MODERN MATERIALS

9 Hrs.

Market forms of Timber- Industrial timber - Plywood - Veneer - Thermocol -False ceiling materials - Panels of laminates - Steel - Aluminum and Other Metallic Materials - Composition - Aluminum composite panel - Preparation of Paints.

UNIT 5 MODERN MATERIALS

9 Hrs.

Glass- Constituents of Glass- Manufacture of Glass- Commercial forms of Glass - Ceramic - Fiber Glass Reinforced Plastic- Clay products - Refractory's - Composite materials - Types - Applications of laminar composites- Fiber textiles - Geo membranes and Geo-textiles for earth reinforcement .

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Understand the applications of basic building materials.
- CO2 - Describe the physical & mechanical properties of aggregates.
- CO3 - Identify the factors to be considered in manufacture process of concrete.
- CO4 - Analyze the usage of timber and composite materials.
- CO5 - Define modern materials, their application for practical purpose..
- CO6 - Solve the problems during the execution of work.

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 10 Questions of 2 marks each - No choice

20 Marks

PART B: 2 Questions from each unit of internal choice; each carrying 16 marks

80 Marks

Employability

Entrepreneurship

Skill Development

SCIA1201	CONCRETE AND CONSTRUCTION TECHNOLOGY	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVES

- To Learn the properties and testing of building materials.
- To study the properties of concrete and concrete mix design.
- To understand the basic concepts of types of concrete.

UNIT 1 INTRODUCTION

11 Hrs.

Mortar - Types - Sand - properties - uses Timber products: properties and uses of plywood, fibre board, particle board. Iron and Steel -Reinforcing steel - types - specifications. Structural steel - specifications miscellaneous materials (only properties, classifications and their use in construction industry): Glass, Plastics, A.C. Sheets, Bitumen, Adhesives, Aluminium. Cement - Different types - Chemical composition and Properties - Hydration of cement - Tests on cement - IS Specifications - Aggregates - Classification - Mechanical properties and tests as per BIS - Grading requirements - Water - Quality of water for use in concrete.

UNIT 2 CONCRETE AND ADMIXTURES

9 Hrs.

Concrete - Aggregates - Mechanical & Physical properties and tests - Grading requirements -Water quality for concrete - Admixtures - types and uses - plasticizers - accelerators - retarders-water reducing agents Making of concrete - batching - mixing - types of mixers -transportation - placing - compacting - curing. Properties of concrete - fresh concrete - workability - segregation and bleeding - factors affecting workability & strength - tests on workability - tests for strength of concrete in compression, tension& flexure Concrete quality control - statistical analysis of results - standard deviation - acceptance criteria - mix proportioning (B.I.S method) - nominal mixes.

UNIT 3 PROPORTIONING OF CONCRETE MIX

8 Hrs.

Principles of Mix Proportioning - Properties of concrete related to Mix Design - Physical properties of materials required for Mix Design - **Design Mix and Nominal Mix - BIS Method of Mix Design - Mix Design Examples**

UNIT 4 FRESH AND HARDENED PROPERTIES OF CONCRETE

9 Hrs.

Workability - Tests for workability of concrete - Segregation and Bleeding - Determination of strength Properties of Hardened concrete - Compressive strength - split tensile strength - Flexural strength - Stress-strain curve for concrete - Modulus of elasticity - durability of concrete - water absorption - permeability - corrosion test - acid resistance- destructive and non destructive test.

UNIT 5 SPECIAL CONCRETES

8 Hrs.

Light weight concretes - foam concrete- self compacting concrete - vacuum concrete - High strength concrete - Fibre reinforced concrete - Ferrocement - Ready mix concrete - SIFCON - Shotcrete - Polymer concrete - High performance concrete - Geopolymer Concrete- Bio Concrete.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the properties of plywood, steel, glass and cement as building materials
- CO2 - Determine the properties of concrete admixtures.
- CO3 - Discuss the mix design of concrete.
- CO4 - Discuss the properties of fresh and hardened concrete.
- CO5 - Determine the uses of special concrete
- CO6 - Recommend the suitable concrete may used in construction

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 10 Questions of 2 marks each - No choice

20 Marks

PART B: 2 Questions from each unit of internal choice; each carrying 16 marks

80 Marks

Employability

Entrepreneurship

Skill Development

SCIA1301	MECHANICS OF SOLIDS - I	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To study and understand the behavior of deformable structural elements, beams and trusses in civil engineering.

UNIT 1 STRESS AND STRAIN

9 Hrs.

Stress & strain - Hooke's law, Application to Prismatic and non prismatic sections, Composite sections. Elastic constants - Poisson's ratio, Young's Modulus, Rigidity Modulus, Bulk Modulus Problems in relation between Elastic constants. Thermal stresses - elongation of a bar due to temperature.

UNIT 2 PRINCIPAL STRESSES AND STRAIN

9 Hrs.

Principal Planes and Principal stresses - Two dimensional stress systems - Mohr's Circle construction for principal stresses. Analysis of Strain - Direct strain on a oblique plane due to direct pull - Direct strain on a oblique plane due to shear stress - strain on inclined section due to two perpendicular normal strains - Mohr's circle of strains.

UNIT 3 BENDING MOMENTS AND SHEAR FORCE

9 Hrs.

Types of Beams, supports and loads - Concept and Significance of Shear force and Bending moment - **Shear force and Bending moment diagram for cantilever, simply supported and overhanging beams.**

UNIT 4 BENDING & SHEAR STRESS DISTRIBUTION, TORSION

9 Hrs.

Stresses in Beams - Simple bending theory - Shear stress distribution for Rectangular and I section - Simple Torsion theory - Stresses and deformations in Solid and Hollow circular shafts.

UNIT 5 ANALYSIS OF TRUSSES

9 Hrs.

Frames - Assumptions - Reactions and supports - Various types of trusses - **Analysis of simple trusses** Method of joints, sections and tension co-efficients.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the stress-strain and axial deformation of prismatic and composite bars.
- CO2 - Construct the mohr's circle to find the principal stresses for two-dimensional system
- CO3 - Evaluate the shear force and bending moment of various beams with different load conditions.
- CO4 - Examine the behavior of beams under bending and shear stresses..
- CO5 - Assess the stresses and deformations of solid shafts and hollow shafts.
- CO6 - Analyse the forces in trusses using various methods..

SCIA1302	MECHANICS OF FLUIDS	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVES

- To understand the basic properties of the fluid, fluid kinematics, fluid dynamics
- To analyse and appreciate the complexities involved in solving the fluid flow problems.
- To develop an understanding of fluid flow patterns and learns to use boundary layer theory and drag.

UNIT 1 FLUID PROPERTIES AND FLUID STATICS

9 Hrs.

Fluid - Definition, - Units and dimensions - Properties of fluids - density, specific weight, specific volume, specific gravity, temperature, viscosity, Types of fluids - Compressibility - Vapour pressure, Capillarity and Surface tension. Fluid statics: Concept of fluid static pressure (Pascal's law and Hydrostatic law), absolute and gauge pressures - Pressure measurements by manometers and pressure gauges - forces on planes (vertical, horizontal and inclined) - Total pressure - centre of pressure - buoyancy - Meta centre.

UNIT 2 FLUID KINEMATICS AND DYNAMICS

9 Hrs.

Fluid Kinematics - Flow visualization - lines of flow - types of flow - velocity field and acceleration - continuity equation (one and three dimensional differential forms) - Equation of streamline - stream function - velocity potential function - circulation - flow net.

Fluid dynamics - equations of motion - Euler's equation along streamline - Bernoulli's equation - applications Venturi meter, Orifice meter and Pitot tube. Momentum equation and its application.

UNIT 3 FLOW THROUGH PIPES

9 Hrs.

Viscous flow - Laminar flow through circular tubes (Hagen poiseuille's) - friction factor - pipe roughness - Major and minor losses of flow in pipes - Darcy - Weisbach's equation - Hydraulic and energy gradient - Pipes in series and in parallel - Moody's diagram

UNIT 4 BOUNDARY LAYER

9 Hrs.

Boundary layer - definition - boundary layer on a flat plate - thickness and classification - displacement, energy and momentum thickness - Boundary layer separation and control - drag in flat plate - drag and lift coefficients.

UNIT 5 DIMENSIONAL ANALYSIS AND MODEL STUDIES

9 Hrs.

Fundamental dimensions - dimensional homogeneity - Rayleigh's method and Buckingham Pi-Theorem Dimensionless parameters - Similitude and model studies - Distorted Models.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Analyse the properties and statics of fluid
- CO2 - Analyze the equation of motion of fluids relevant to flow measurement devices.
- CO3 - Determine the major and minor losses in pipe flow
- CO4 - Solve the boundary layer problems in pipes and arbitrary bodies and examines the lift and drag.
- CO5 - Apply the principles of dimensional analysis in fluid mechanics.
- CO6 - Interpret the prototype and model for fluid flow condition

SCIA1303	SURVEYING - I	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To study the basic principles of surveying and calculate the area by considering various aspects with optimization technique used in plane surveying and geodetic surveying.

UNIT 1 FUNDAMENTAL KNOWLEDGE OF CONVENTIONAL SURVEYING

7 Hrs.

Unit Conversion - Basic principles of surveying - Conventional Signs - Scales - Accessories used for ranging - **Ranging** - classification of surveying.

UNIT 2 APPLICATION OF VARIOUS INSTRUMENTS IN PLANE SURVEYING

12 Hrs.

Measurements of distance, angles and direction by different types of instrument (Chain, Compass and Plane table surveying), used in the plane surveying. Method of leveling - curvature and refraction correction - contouring - computation of volumes - **measurement of cross section** - practical problems. Sources of errors in measurements.

UNIT 3 APPLICATION OF THEODOLITE

10 Hrs.

Basic principles of theodolite - fundamentals of theodolite - Heights and distances - Omitted measurements - Types of Curves - **Setting out simple Curves, compound curves and transition curves.**

UNIT 4 DISTANCE AND ELEVATION BY TACHEOMETRY

9 Hrs.

Tacheometry - Stadia tacheometry - Tangential tacheometry - **Triangulation** - Classification of triangulation - Signals - Station - types of station - Baseline - Method of Baseline - Adjustments.

UNIT 5 CONTROL SURVEYING AND ITS ADJUSTMENT

7 Hrs.

Basic of Geodetic surveying with horizontal and Vertical control - classification of errors - true and most probable values - principles of least square - normal equation - method of correlates.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

CO1 - Compute the area of land based on linear measurements using chain instrument.

CO2 - Estimate the area of land based on angular measurements using prismatic compass and plane table instruments.

CO3 - Estimate both area and volume for cutting and filling of earthwork using dumpy level instrument.

CO4 - Compute angular measurements, distance and elevation difference between two station points using theodolite instrument in the field.

CO5 - Conduct various types of engineering survey for engineering projects.

CO6 - Set out horizontal and vertical curves for roadways and railways.

SCIA1304	HIGHWAY ENGINEERING	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To understand the concept of planning, design, construction and maintenance of highways as per Indian Road Congress standards, specifications and methods in Highway Engineering.

UNIT 1 HIGHWAY DEVELOPMENT, PLANNING AND ALIGNMENT

9 Hrs.

Introduction to Transportation systems - Highway development in India - Classification of Roads - Planning of roads - Significance of Highway planning - Highway alignment - factors influencing highway alignment - Planning or Engineering surveys for alignment: objectives, conventional and modern methods - Sustainability and its importance in Highway Engineering

UNIT 2 GEOMETRIC DESIGN ELEMENTS

9 Hrs.

Cross section of Urban and Rural Roads - Cross sectional elements - Sight distance - Horizontal Curves, Super elevation, Transition Curves, Widening of pavement on curves - Vertical Curves, Gradient (problems included) - Considerations on Hill Roads, Hairpin Bends - Lateral and Vertical Clearance of Underpasses

UNIT 3 HIGHWAY MATERIALS AND CONSTRUCTION PRACTICE

9 Hrs.

Highway construction materials and its properties - CBR test on Sub grade soil - Tests on Aggregates - Tests on Bitumen and Bituminous Mix Design - Construction procedure of Bituminous Roads and Cement Concrete Roads - Recycled materials - Quality Control Measures - Construction Machineries

UNIT 4 PAVEMENT DESIGN

9 Hrs.

Pavement Components and their role - Types of Pavements: Flexible and Rigid - Design of Flexible and Rigid Pavements (IRC Methods only) - Joints in Rigid Pavements

UNIT 5 PAVEMENT EVALUATION AND MANAGEMENT

9 Hrs.

Types of Pavement failures - Pavement Maintenance - Pavement evaluation: Surface and Structural - Pavement Management System - Strengthening of pavements - Highway drainage - Formulation of Highway Project report

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Apply knowledge on engineering survey for highway planning and its alignment
- CO2 - Evaluate the geometric design elements of roadways
- CO3 - Assess the properties of materials for the construction of various roads
- CO4 - Design the flexible and rigid pavements based on codal provisions
- CO5 - Adopt pavement management system for repairing and strengthening of pavements
- CO6 - Plan roads on water logged areas and desert sand with suitable drainage system

SCIA1401	MECHANICS OF SOLIDS - II	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn the computation of deflection of beams, columns, thin and thick cylindrical shell and also various theories of failure.

UNIT 1 SLOPE AND DEFLECTION OF BEAMS

9 Hrs.

Double integration method - Macaulay's method - Moment area method - Conjugate beam method for simply supported and cantilever beams - **problems in finding slope & deflection of beams.**

UNIT 2 STRAIN ENERGY

9 Hrs.

Strain energy - Strain energy due to axial forces, Strain energy due to bending, Strain energy in pure shearing, Strain energy in torsion. Castiglione's first theorem - Betti's theorem - **Maxwell's law of Reciprocal deflection** - problems in calculating the Strain Energy.

UNIT 3 THEORY OF COLUMNS

9 Hrs.

Axial load combined bending and axial load - Euler's formula for long struts - Limitations of Euler's formula Long columns under eccentric loading - Secant, Perry's & IS code formula. Rankine, Gordon's formula - problems in finding the safe load on the column.

UNIT 4 THIN CYLINDERS AND SPHERES, THICK CYLINDERS

9 Hrs.

Stresses in Thin cylindrical shell due to internal pressure - Deformation in Thin cylinders - Spherical shells subjected to internal pressure - Deformation in Thin spherical shells. Thick cylinders - Lamé's equation - Shrink fit Compound cylinders.

UNIT 5 THEORIES OF FAILURE

9 Hrs.

Theories of Failure - Maximum Principal Stress theory - Maximum Principal strain theory - Maximum shear stress theory - Strain energy theory - shear strain energy theory - problems in finding factor of safety - Graphical representation of theories for two dimensional stress system.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Evaluate the slope and deflection with various load conditions in cantilever and simply supported beams
- CO2 - Apply Castiglione's first theorem, Betti's theorem and strain energy concepts..
- CO3 - Illustrate the behavior of columns with different end conditions.
- CO4 - Examine the behavior of columns with eccentric Loading
- CO5 - Estimate the stresses produced for thin and thick cylinder
- CO6 - Analyze the failure of material using various theories.

SCIA1402	APPLIED HYDRAULIC ENGINEERING	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVES

- To introduce the students to various hydraulic engineering problems like open channel flows and hydraulic machines.
- At the completion of the course, the student should be able to relate the theory and practice of problems in hydraulic engineering.

UNIT 1 UNIFORM FLOW

9 Hrs.

Free surface flows - comparison with pipe flow, Classification of flow in open channels. Uniform flow Equations for uniform flow - Chezy's and Manning's equations, Most efficient channel sections of different geometry, Velocity distribution in open channels- Determination of normal depth and velocity, Specific energy and Specific force diagrams, Critical flow in rectangular channel.

UNIT 2 GRADUALLY VARIED FLOW

9 Hrs.

Dynamic Equation for gradually varied flow - in wide rectangular channels - different forms of the dynamic equation, channel bottom slopes - Study of surface profiles and its Characteristics in prismatic channels, backwater computation Direct step method and Standard step method, Graphical method - Applications.

UNIT 3 RAPIDLY VARIED FLOW

9 Hrs.

Rapidly varied flow, hydraulic jump - initial and sequent depths, non-dimensional equation, Practical application of hydraulic jump, Types of jump in horizontal floor, Basic characteristics of the jump, Energy loss, efficiency, height of jump. Energy dissipation - Surges and surge through channel transitions.

UNIT 4 TURBINES

9 Hrs.

Impact of Jet on vanes - Turbines - classification - impulse turbines - Pelton wheel -Reaction turbines - Francis and Kaplan Turbines - draft tubes - Governing of a Francis turbine - Performance of turbines - specific speed and their significance.

UNIT 5 PUMPS

9 Hrs.

Centrifugal pump: description and working - Head, discharge and efficiency - pressure rise - minimum starting speed - cavitation - priming - multistage pumps -characteristic curves. Reciprocating pump: Description and working types - discharge and slip - power required to drive the pump-Indicator diagram - Airvessel - work done against friction with and without airvessels.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

CO1 - Analyze the flow in open channels for the most economical sections.

CO2 - Evaluate the Gradually varied flow profiles for prismatic channel.

CO3 - Analyze the rapid flow profile and its hydraulic transients.

CO4 - Identify the components, working principles and function of various turbines CO5

- Identify the components, working principles and function of various pumps CO6 -

Determine the power required for driving the pumps and turbines

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 10 Questions of 2 marks each - No choice

20 Marks

PART B: 2 Questions from each unit of internal choice; each carrying 16 marks

80 Marks

Employability

Entrepreneurship

Skill Development

SCIA1403	ENVIRONMENTAL ENGINEERING - I	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVES

- To create the awareness and importance of the water among the students for public usage with following the standards.
- To equip the students with the principles and design of water treatment units and distribution system.

UNIT 1 WATER AND ENVIRONMENT

9 Hrs.

Objectives of public water supply - Requirements of water supply - Need of protected water supply - Planning factors for public water supply - Types of demand - Rate of consumption - Factors affecting the rate of consumption population Forecasting Methods and its applications - Variation in demand pattern - Sources of water - Types Quantitative and qualitative studies.

UNIT 2 CONVEYANCE OF WATER

10 Hrs.

Intake and intake works - Channels and pipes for conveying water - Hydraulic design of pressure pipe Materials for pipes - Selection, specification and applications - CI, GI, Steel, RCC, AC and plastic - Laying of pipes Jointing and testing of pipes - Appurtenances of pipes - Corrosion of pipes and prevention. Pumps and pumping stations - Suitable location for pumping station - Selection of pumps.

UNIT 3 QUALITY OF WATER

8 Hrs.

Analysis of water - physical, chemical & bacteriological characteristics - Coliform test, Algae toxins and Algae index - Most Probable Number - Sampling - Drinking water standards - Water borne diseases

UNIT 4 TREATMENT OF WATER

9 Hrs.

Objectives - Layout of treatment plants - Theory, principles, types and design of Sedimentation, coagulation, flocculation and filtration - Disinfection - Iron and Manganese Removal - De-fluoridation - **Water softening Desalination Membrane filtration**

UNIT 5 DISTRIBUTION SYSTEM

9 Hrs.

General requirements, Classification - Methods of supply - Storage and distribution reservoirs - Function, classification, Balancing or equalizing tank - Capacity - Layout of distribution system - Analysis of distribution networks Equivalent pipes and Hardy cross method - Operation and maintenance - Leak detection - Appurtenances - Water supply to buildings.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Estimate the water demand based on growing population
- CO2 - Design the hydraulic pressure pipes for conveyance of water
- CO3 - Analyze the physio-chemical and biological characteristics of drinking water as per quality standards
- CO4 - Design the various units of water treatment plant
- CO5 - Layout the suitable water distribution systems
- CO6 - Analyze the various water supply distribution networks

80 Marks

Employability

Entrepreneurship

Skill Development

SCIA1404	SURVEYING - II	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To determine the area and volume with different plane are calculated with current method, considering with filed observation.

UNIT 1 HYDROGRAPHIC SURVEY

7 Hrs.

Tides - Prediction of tides - Tide gauges - Sounding - Method of Locating soundings - Three point problems - Reduction of sounding and Plotting of sounding - stream measurements.

UNIT 2 AERIAL PHOTOGRAPHY

7 Hrs.

Aerial Survey - Terrestrial stereo photography - Aerial photography - Scale of vertical photography - Scale of vertical Tilted photograph - Photo interpretation - Parallax.

UNIT 3 REMOTE SENSING AND GIS

9 Hrs.

Remote sensing - basic procedure of setting out remote sensing - electromagnetic spectrum - energy interaction with earth surface - remote sensing in India - Global Information system - Hardware of GIS - Software of GIS - vector and raster data - Application of GIS - Remote sensing and GIS

UNIT 4 ASTRONOMICAL SURVEYING

12 Hrs.

Astronomical terms and definition - Celestial sphere - Motion of sun and stars - Physical characteristics of the sun, the moon, the planets and satellites - Field observation - spherical trigonometry - Napier's rule of circular parts - determination of hour angle, azimuth, Latitude and longitude of a place and time.

UNIT 5 TOTAL STATION AND ITS APPLICATION

10 Hrs.

Total Station - advantages of total station - principles of total station - application of total station - basic elements of total station - parts and accessories - errors - problems.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine elevation and depression of a station point using tacheometric surveying.
- CO2 - Determine distance and relative position of points in the field using triangulation method..
- CO3 - Rectify the errors found in angular measurements in the field using different methods.
- CO4 - Locate the positions of water bodies and astronomical co-ordinates..
- CO5 - Locate the position of ground points using aerial Camera.
- CO6 - Operate modern surveying equipments like total station, electronic distance measuring instruments.

SCIA1501	STRUCTURAL ANALYSIS - I	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn the modern method of analysis of beams, frames, Arches, Suspension and Bridges.

UNIT 1 FIXED AND CONTINUOUS BEAMS

9 Hrs.

Introduction - statically indeterminate beams and frames. Fixed beam - Bending moment and Shear force diagram-Slope and Deflection - point load and UDL - Continuous beams - Theorem of three moments - Bending moment and shear force diagram.

UNIT 2 SLOPE DEFLECTION METHOD

9 Hrs.

Analysis of continuous beams with and without settlement - Rigid plane frames with and without sway.

UNIT 3 MOMENT DISTRIBUTION METHOD

9 Hrs.

Stiffness and carry over factors - Distribution and carryover of moments - Analysis of continuous Beams with and without settlement - Plane rigid frames with and without sway.

UNIT 4 ARCHES

9 Hrs.

Theoretical Arch - Eddy's theorem analysis of two and three hinged arches for parabolic and circular, Settlement and Temperature effect.

UNIT 5 CABLES AND SUSPENSION BRIDGES

9 Hrs.

General Cable theorem - Analysis of cables under Concentrated and Uniformly Distributed Loads-Shape and Stresses due to self weight - Anchor Cables - Temperature effect - Suspension bridges with three hinged and two hinged stiffening girders.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the Bending moment, Shear force and Deflection of Fixed beams with various loading cases
CO2 - Discuss the theorem of three moments and its application in Continuous beams with various conditions
CO3 - Analyse the continuous beams, and Frames with various conditions by using Slope deflection method.
CO4 - Analyze beams and frames by moment distribution method
CO5 - Analyse the types of Arches by using various Theorems and methods.
CO6 - Analyze the cables and suspension bridges

SCIA1502	REINFORCED CONCRETE STRUCTURES - I	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To introduce the various philosophies of R.C. design and to study in detail the limit state design of structural elements such as beams, columns and footings.

UNIT 1 BASIC CONCEPTS**9 Hrs.**

Properties of Reinforced concrete materials, Stress - Strain diagrams of concrete and steel, Design philosophies (Principles of Elastic method, ultimate load and limit state method) Design code and specification. Behaviour of RC beams in bond development length and Anchorage, Loading standard as per IS 875. Behavior of RC structural systems under gravity and lateral load.

UNIT 2 BEAMS**9 Hrs.**

Flexure of RCC beams of rectangular section - Balanced, Under Reinforced and Over Reinforced Sections. Analysis and Design of Singly and Doubly Reinforced beams - Design of flanged Sections (T and L beams) and Continuous Beams - Analysis and design with and without shear reinforcement as per IS: 456.

UNIT 3 SLABS**9 Hrs.**

Analysis and Design of one way and two way slab for uniformly distributed load, various Boundary conditions and corner effects. Design of continuous slabs - Using code Coefficient.

UNIT 4 COLUMNS**9 Hrs.**

Behaviour of Columns, Types of columns, Design of Axially loaded and Eccentrically loaded columns - Using IS: 456 & SP -16.

UNIT 5 FOOTINGS**9 Hrs.**

Types of footing, SBC of soil - Design loads - Design of axially and eccentric loaded rectangular footing Combined rectangular footing.

Max. 45 Hrs.**COURSE OUTCOMES**

On completion of the course, student will be able to

- CO1 - Apply design philosophies as per codal provisions in reinforced concrete structures.
- CO2 - Design the beams to resist bending, shear and torsion based on limit state method.
- CO3 - Design the slabs for various boundary conditions and corner effects.
- CO4 - Design suitable columns under different loading conditions
- CO5 - Design appropriate footings to axial and eccentric loading.
- CO6 - Analyse the given reinforced concrete element.

Skill Development

SCIA1503	DESIGN OF STEEL STRUCTURES - I	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn the design of steel Components and structures using Limit State Design method subjected to external loading.

UNIT 1 INTRODUCTION**9 Hrs.**

Material properties of steel - Structural steel sections and their properties - General design requirements Limit state design concepts - Loads on structures - Classification of sections.

UNIT 2 CONNECTIONS**9 Hrs.**

Types of connections - Riveted, Bolted and Welded connections - Failure modes of bolts - Design of ordinary and high strength friction grip bolts - Types of welded connections and failure modes - Design of welded connections - Eccentric connections - Efficiency of joints.

UNIT 3 DESIGN OF TENSION MEMBERS**9 Hrs.**

Types of Tension members - Net area - Net effective sections - concept of shear lag - Design strength of simple and compound members - Use of lug angles - Design of tension splices.

UNIT 4 DESIGN OF COMPRESSION MEMBERS**9 Hrs.**

Types of compression members - Theory of columns - column curves - Effective length of compression members - Slenderness ratio - Design of simple and compound section compression members - Design of lacing and battened types of columns - Design of column bases and column splicing.

UNIT 5 DESIGN OF MEMBERS SUBJECTED TO BENDING**9 Hrs.**

Effective span of beams - Design strength in bending - Laterally supported beams - Laterally unsupported beams - Effective length for lateral torsional buckling - Design for shear - Web crippling and web buckling - Members subjected to combined forces - Biaxial bending - Purlins and Girts.

Max. 45 Hrs.**COURSE OUTCOMES**

On completion of the course, student will be able to

- CO1 - Apply the codal provisions of Limit State method as per IS 800: 2007 in steel structure
- CO2 - Design the different types bolted and Welded connections in steel structures
- CO3 - Design the simple and compound tension members
- CO4 - Design the simple and compound compression members along with base plates..
- CO5 - Design the different types of beams subjected to various modes of local buckling.
- CO6 - Design the purlins and girts subjected to biaxial bending.

END SEMESTER EXAMINATION QUESTION PAPER PATTERN**Max. Marks: 100****Exam Duration: 3 Hrs.****PART A:** 10 Questions of 2 marks each - No choice**20 Marks****PART B:** 2 Questions from each unit of internal choice; each carrying 16 marks**80 Marks**

SCIA1504	SOIL MECHANICS	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVES

- To develop an understanding of the relationships between physical characteristics and mechanical properties of soils.
- To understand and experience experimental measurement of the physical and mechanical soil properties commonly used in engineering practice.
- To understand and be able to apply the modeling and analysis techniques used in soil mechanics: (a) Darcy's Law and flow-nets for seepage (b) consolidation models for load-time deformation responses of soils (c) Mohr's - Coulomb models for shear strength behavior of soils.

UNIT 1 SOIL PROPERTIES

9 Hrs.

Objectives and Values of Geotechnical Engineering - Nature of soil, Formation of soil and functional relationships - **types of soil and the soil properties** - Phase relations - Index properties - Specific gravity using pycnometer and specific gravity bottle - Grain size analysis - sieve analysis and hydrometer analysis - **Consistency of soils - Atterberg's limit** - soil classification for Engineering purposes - Classification of coarse grained and fine grained soil as per BIS - Soil deposits in India.

UNIT 2 SOIL WATER AND WATER FLOW

7 Hrs.

Effective and Neutral stress - capillary stress - **Permeability measurement in the laboratory** and field pumping in and pumping out tests - **Factors influencing permeability of soils** - Seepage - Introduction to Flow net - Simple problems.

UNIT 3 COMPRESSIBILITY AND CONSOLIDATION

9 Hrs.

Compaction - Proctor test and Modified proctor test - Concept of OMC and maximum dry density - Zero air voids line - **Factors influencing compaction** - Effect of compaction in soil properties - Difference between consolidation and compaction - Definition - Concepts of coefficient of compressibility - Components of settlement Immediate and consolidation settlement - **Terzaghi's one dimensional consolidation theory** - Governing differential equation - Laboratory consolidation test - Field consolidation curve- Introduction to sand drain, radial drainage and vacuum consolidation - Problems on final and time rate settlement.

UNIT 4 STRESS DISTRIBUTION AND SHEAR STRENGTH

11 Hrs.

Stress distribution in soil media - **Boussinesque's and Westergaard's equations for vertical pressure due to point loads and uniformly distributed loads** - assumptions and limitations - pressure bulb - Newmark's influence chart - principle, construction and use - line loads and strip loads - **Shear strength of cohesive and cohesionless soils Mohr's Coulomb failure theory** - Saturated soil - Strength parameters - Measurement of shear strength, Direct shear, Triaxial compression, UCC and Vane shear tests - **Types of shear tests based on drainage and their applicability Drained and undrained behaviour of clay and sand** - Stress path for conventional triaxial test.

UNIT 5 SLOPE STABILITY

9 Hrs.

Slope failure mechanisms - Modes - Infinite slopes - Finite slopes - **Total and effective stress analysis** - Stability analysis for purely cohesive and Cohesion less soils - Method of slices - Modified Bishop's method - Friction circle method - Stability number - problems - Slope protection measures.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Assess the index properties of given soil for its classification
- CO2 - Analyze the total and effective pressure components based on permeability characteristics
- CO3 - Evaluate compressibility and consolidation behavior of soil.
- CO4 - Predict different components of soil settlement and rate of settlement
- CO5 - Evaluate the theory of stress distribution and shear strength parameters for different field conditions
- CO6 - Analyze stability of slopes for cohesive and cohesionless soil

 Skill Development

SCIA1505	ENVIRONMENTAL ENGINEERING - II	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To implicate the importance of sewerage system and treatment of wastewater.
- To help students develop the ability to apply basic understanding of physical, chemical and biological phenomena for successful design, operation and maintenance of sewage treatment plants.

UNIT 1 SEWERAGE SYSTEM**9 Hrs.**

Sewage, Sewerage - Classification - Quantity of sanitary sewage - Estimation of sanitary sewage and storm runoff - Fluctuations - Hydraulics of sewer - Shapes and materials of sewer - Design criteria for sewer system - Ventilation - Recent Methods on Cleaning of Sewers.

UNIT 2 LAYOUT OF SEWERAGE SYSTEM**9 Hrs.**

Laying, jointing and testing of sewers - Sewer appurtenances, Principles governing the design for drainage in buildings - Plumbing systems for drainage - Layout of house Drainage - Pumps - Selection of pumps and pipe drainage.

UNIT 3 CHARACTERISTICS OF SEWAGE**8 Hrs.**

Characteristics and composition of sewage - Method of sampling - Analysis of Sewage - Physical, Chemical (DO, COD and BOD and their significance) and Microbiological characteristics - Population equivalent, Relative stability - Decomposition of sewage - Nitrogen, Sulphur and Carbon cycles

UNIT 4 TREATMENT OF SEWAGE**10 Hrs.**

Objectives - Layout of treatment plants - Screening, grit chambers, skimming tanks, grease traps Sedimentation tank - Trickling filter Activated Sludge Process - UASB - Oxidation pond - Septic tank.

UNIT 5 DISPOSAL OF SEWAGE AND SLUDGE MANAGEMENT**9 Hrs.**

Objectives, Methods, dilution and irrigation - Disposal standards for dilution and irrigation of sewage effluent self purification of streams-oxygen sagcurve -Land disposal-Sewage farming-Soil dispersion system-Sludge Characterization - Sludge Digestion - Sludge conditioning and dewatering - Sludge disposal

Max. 45 Hrs.**COURSE OUTCOMES**

On completion of the course, student will be able to

- CO1 - Discuss the types of sewerage systems and quantity estimation of sewage and storm runoff.
- CO2 - Design of sewer pipes and various plumbing systems for drainage.
- CO3 - Analyze the characteristics of sewage.
- CO4 - Design the wastewater treatments units in a cost effective and sustainable way.
- CO5 - Develop the layout of wastewater treatment plants..
- CO6 - Discuss the methods of sewage disposal and sludge management.

SCIA1506	WATER RESOURCES ENGINEERING	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVES

- To introduce the theoretical concepts in hydrological components and understanding of water resources systems and to develop the skills in modeling of flood flows and flood routing.
- To develop skills in the ground water flow, type of aquifer and yield from the well.
- To provide the knowledge of design of reservoir, operation and sedimentation.
- To study the effect, causes and remedial measures of watershed management

UNIT 1 INTRODUCTION

8 Hrs.

Water resources projects - Introduction - Water resources of India - Range of water resources projects General planning philosophy - Water allocation priorities - Irrigation - Flood control - Hydropower. Data requirement and data collection for different projects - Water availability studies. Environmental checklist for Water Resources projects. - **Intergrated Water Resources Management - Key issues in water management - Concepts and principles of Water Management - Benefits of IWRM to various sectors - Environment, Agriculture, Water supply and sanitation**

UNIT 2 BASIC CONCEPTS OF HYDROLOGY

10 Hrs.

Hydrologic cycle - rainfall and its measurement - computation of mean rainfall over a catchment area using arithmetic mean, Thiessen polygon and Isohyetal methods - Abstraction from rainfall - evaporation, factors affecting evaporation, measurement of evaporation - evapotranspiration - Infiltration, factors affecting infiltration, measurement of infiltration, infiltration indices. Runoff - components of runoff, factors affecting runoff, stream gauging, effective rainfall, separation of base flow.

UNIT 3 GROUND WATER HYDROLOGY

10 Hrs.

Soil water zones, Soil moisture relations Specific retention, Specific yield. Occurrence of ground water - Types of aquifers - unconfined aquifer, confined aquifer, aquitard - Storage coefficients - coefficient of permeability and transmissibility, Steady radial flow into a well under confined and unconfined condition, pumping and recuperation tests, Tube wells and Open wells - yield from an open well.

UNIT 4 RESERVOIR PLANNING

8 Hrs.

Reservoir planning: Investigation - selection of site - storage zones in a reservoir - mass inflow curve - demand curve - calculation of reservoir capacity and safe yield from mass inflow curve - reservoir sedimentation reservoir sediment control. Single and multipurpose reservoirs.

UNIT 5 WATERSHED MANAGEMENT

9 Hrs.

Flood and Drought: Design flood - assessment and mitigation measures - causes - methods of flood control, flood forecasting - Drought assessment and mitigation measures. Levees and flood walls, Channel improvement. Delineation of basin boundary - **watershed management. Remote sensing application to water resource engineering** - case study. **Max. 45 Hrs.**

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the information required for water resource planning
- CO2 - Analyze the factors affecting hydrology
- CO3 - Develop skills in the concepts of groundwater flow and the types of aquifers
- CO4 - Plan the location and storage capacity of reservoir
- CO5 - Access the causes of flood and drought and its mitigation measures
- CO6 - Acquire the knowledge in watershed management and applications of water resource engineering

 Skill Development

SCIA1601	STRUCTURAL ANALYSIS - II	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn the influence lines and its uses in various applications like bridge arches. Also to learn advanced methods like matrix methods of structural analysis of structures, plastic theory.

UNIT 1 ROLLING LOADS

9 Hrs.

Rolling loads - Single Concentrated load - Uniformly distributed load - Two Concentrated loads - System of moving loads - Curves of maximum B.M.D. and S.F.D. - Equivalent UDL.

UNIT 2 INFLUENCE LINE FOR STATICALLY DETERMINATE AND IN DETERMINATE STRUCTURES

9 Hrs.

Influence line for Statically Determinate Beams for Bending moment and Shear force - Muller Breslau's Principles and its application to determine the influence lines of reactions. S. F and B. M at a section of continuous beams - propped cantilevers - Qualitative influence lines for Horizontal thrust, reactions and moments for portal frames.

UNIT 3 FLEXIBILITY MATRIX METHOD

9 Hrs.

Definition and determination of Static and Kinematic Indeterminacy - Concepts co-ordinates - element transformation approach - **Applications to analysis of continuous beams and rigid jointed plane frames.**

UNIT 4 MATRIX STIFFNESS METHOD

9 Hrs.

Element and global stiffness matrices - Co-ordinate transformations - Rotation matrix - transformations of stiffness matrices - Analysis of Continuous Beams - and rigid jointed plane frames - Introduction to FEM.

UNIT 5 PLASTIC ANALYSIS OF STRUCTURES

9 Hrs.

Introduction - Ductility of steel - Beams in pure bending - Stages of bending in beams - **Plastic modulus Shape factor** - Load factor - Plastic hinge and mechanism - Upper and lower bound theorems - Static and Kinematic methods - Plastic analysis of indeterminate Beams and frames.

Max.45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Predict the position of rolling loads in beams..
- CO2 - Determine the shear force and bending moment for determinate and indeterminate structure
- CO3 - Analyse the beams and frame using flexibility matrix method.
- CO4 - Analyse the beams and frame using stiffness matrix method.
- CO5 - Elaborate the concepts of the plastic theory..
- CO6 - Determine collapse load for Indeterminate beams and frames.

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 10 Questions of 2 marks each - No choice

20 Marks

PART B: 2 Questions from each unit of internal choice; each carrying 16 marks

80 Marks

Employability

Entrepreneurship

Skill Development

SCIA1602	REINFORCED CONCRETE STRUCTURES - II	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn design of R.C staircase, Circular, flat slabs, Retaining walls, Water tanks, and concept of yield line theory.

UNIT 1 STAIRCASES

9 Hrs.

Stair case, Components of stair case, Types of stair case - **Limit state design of dog legged and open newel staircase.**

UNIT 2 YIELD LINE THEORY

9 Hrs.

Concept of yield line theory - **Determination of collapse load and design of rectangular, circular and triangular slabs (formulas only).**

UNIT 3 CIRCULAR SLABS AND FLAT SLABS

9 Hrs.

Limit state design of circular slabs - Simply Supported and fixed with UDL. **Design of flat slabs by direct design method according to IS code.**

UNIT 4 RETAINING WALL

9 Hrs.

Limit state design of retaining walls, Design of Cantilever and Counter fort types

UNIT 5 WATER TANKS

9 Hrs.

Types of water tanks - **Design of water tanks using Elastic method** - resting on ground - Underground rectangular - overhead circular and rectangular with staging.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Design different types of staircases based on Limit State Design method
- CO2 - Apply the concept of yield line theory in the design of slabs
- CO3 - Design different cases of circular slab and flat slab.
- CO4- Design the different types of retaining wall
- CO5 - Estimate the various loads acting on the water tank
- CO6 - Design the different types of water tank based on working stress method

SCIA1603	DESIGN OF STEEL STRUCTURES - II	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To learn the design of Plate girders, Industrial structures, water tanks, Bunkers, Silos and Light gauge sections.

UNIT 1 PLATE GIRDERS

9 Hrs.

Introduction - types of sections - elements of plate girder - general considerations - end panel design - tension field action - design of plate girders with solid webs - flange splices - connection of flanges to web - stiffener design various types of stiffeners -

UNIT 2 ROOF TRUSSES AND INDUSTRIAL STRUCTURES

9 Hrs.

Roof trusses - Roof and side coverings - Design loads, Design of purlin and elements of truss - end bearing Design of gantry girder - Introduction to Tekla software, Basic 3D Modeling, System Components, Interactive Modeling & Building Custom Components, Modeling Techniques, Structural Profiles and Materials, Numbering and reports, Principles of working with drawings

UNIT 3 WATER TANKS

9 Hrs.

Introduction - permissible stresses - thickness specifications - elevated tanks - circular tanks - rectangular tanks - pressed steel tanks.

UNIT 4 BUNKERS AND SILOS

9 Hrs.

Introduction - Janssen's theory - Airy's theorem - Design parameters - Design criteria - analysis of bins Hopper bottom - design of bins.

UNIT 5 LIGHT GAUGE SECTIONS

9 Hrs.

Design of light gauge steel members - local and post buckling of thin elements - light gauge steel compression members - tension members - beams and connections.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Design the elements of plate girder as per the codal provision
- CO2 - Design the various members like roof truss, purlin and gantry girder of industrial structures..
- CO3 - Design the elevated water tanks of rectangular and circular shapes..
- CO4 - Design the Bunkers and Silos with current parameters
- CO5 - Analyze the different cold formed steel sections as per the codal provision
- CO6 -- Design the various structural members using light steel gauges.

Skill Development

SCIA1604	FOUNDATION ENGINEERING	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVES

- To learn about types and purposes of different foundation systems and structures.
- To provide students with exposure to the systematic methods for designing foundations.
- To discuss and evaluate the feasibility of foundation solutions to different types of soil conditions considering the time effect on soil behavior.
- To build the necessary theoretical background for design and construction of foundation systems.

UNIT 1 SOIL EXPLORATION AND SITE INVESTIGATION

9 Hrs.

Introduction - Planning and stages in sub-surface exploration - depth and spacing of exploration - **Methods of exploration** - Test pit - Trenches - Geophysical methods Seismic refraction and Electrical resistivity method - Boring Auger boring, Shell and Auger, Wash boring and Rotary drilling - Types of soil sample: disturbed and undisturbed soil samples - Features of sampler affecting soil disturbance - standard penetration test - static and dynamic cone penetration test - bore log report - selection of foundation and justification.

UNIT 2 BEARING CAPACITY ON SETTLEMENT

9 Hrs.

Introduction - Bearing capacity - definition - types of shear failure - Bearing capacity of shallow foundation on homogeneous deposits - Methods: Terzaghi's, Skempton's and BIS methods- **Effect of water table on bearing capacity** - **Plate load test** - Bearing capacity from in-situ tests - SPT, SCPT and plate load test - methods of improving bearing capacity of soil - **Settlement**: total and differential settlements - causes and methods of minimizing settlement.

UNIT 3 SHALLOW FOUNDATION

9 Hrs.

Types of foundation - contact pressure distribution below isolated footing - types and proportioning of combined footing - types and application of mat foundation - floating foundation - shell foundation - spread footing - codal provision

UNIT 4 DEEP FOUNDATION

9 Hrs.

Types and function of pile - factors influencing the selection of pile - carrying capacity of single pile in cohesionless and cohesive soil - static formula - dynamic formulae (Engineering News and Hileys) - Capacity from in-situ tests (SPT and SCPT) - Negative skin friction - **Carrying capacity of Pile group** - Pile load test - Under-reamed piles - well foundation.

UNIT 5 EARTH PRESSURE ON RETAINING WALLS

9 Hrs.

Plastic equilibrium in soils - **Earth pressure in soils**: Active and passive states - Rankine's theory - Cohesionless and cohesive soil - Coulomb's wedge theory - Condition for critical failure plane - Earth pressure on retaining walls of simple configurations - Culmann's Graphical method - Pressure on the wall due to line load - Stability analysis of retaining walls - Codal provisions.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Propose appropriate soil exploration methods for conducting site investigations
- CO2 - Determine bearing capacity of soil under different water table conditions
- CO3 - Design suitable shallow foundations for different soil conditions and loadings
- CO4 - Evaluate load carrying capacity of individual and group piles for different soil conditions and loadings
- CO5 - Determine active and passive earth pressure for different types of soil
- CO6 - Choose appropriate methods of slope protection for enhancing stability of structures

 Skill Development

SCIA1701	RAILWAYS, AIRPORT AND HARBOUR ENGINEERING	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To expose the students to Railway planning, design, construction and maintenance
- To gain knowledge on planning and design principles of Airports and Harbours.

UNIT 1 RAILWAY PLANNING

9 Hrs.

Development of railways in India - Comparison of roadways and railways - Components of a permanent way and its functions - Rails, Gauges and its selection, Sleepers, Ballast, Formation, Rail fittings and fastenings - Coning of wheels Defects in rails: creep and shift in rails, Track Stress - Gradient - Super elevation and Negative super elevation - Permissible speed on curve (Problems included) - Widening of gauge on curves.

UNIT 2 RAILWAY CONSTRUCTION AND MAINTENANCE

9 Hrs.

Alignment surveys - Track construction - Calculation of Materials required for track laying - Stabilization of track on weak soil - Track maintenance - Track drainage - Types of stations and Types of station yards: Passenger, Goods, Marshalling and Locomotive - Station equipments - Introduction to Modern Developments in Railways.

UNIT 3 POINTS AND CROSSINGS, URBAN RAILWAYS

7 Hrs.

Types of Points / Switches - Types of crossing - Design calculation of Turnout - Types of Track junctions - Types of signals and their location - Introduction to Railways in Metro Cities.

UNIT 4 AIRPORT PLANNING AND DESIGN

10 Hrs.

Air transport characteristics - Classification of airports - Factors influencing the selection of new airport site and ICAO stipulations - Layout characteristics, Socio-economic characteristics of the catchment area - Components of Airport - Runway Orientation - Wind Rose Diagram - Problem on Basic and Actual runway length - Aircraft Parking system - Drainage - Airport Zones - Runway and Taxiway Markings and lighting - Design standards and planning of Airport as per Indian condition.

UNIT 5 WATERWAYS

10 Hrs.

General terminologies - Ports: Classification, Requirements - Docks: Classification - Harbour: Classification, Requirements - Harbour Layout and Terminal Facilities - Coastal Protection Structures - Pier, Breakwaters, Wharves, Jetties, Quays, Fenders, Dolphins and Landing stage - Wave action on coastal structures - coastal protection and zone under coastal regulation - Inland Water Transport and Container transportation.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, students will be able to

- CO1 - Assess the functions of various components of railway permanent way
- CO2 - Plan for construction, maintainance and drainage of railway track and the station yards
- CO3 - Determine the types of points, crossings and track junctions in railway and the functions of signals and interlocks.
- CO4 - Plan an airport layout with its componemts.
- CO5 - Analys the Requirements of sea port and harbour with its Coastal Protection Structures
- CO6 -Discuss the importance and present status of Inland water transport and container transportation

SCIA1702	ESTIMATION, COSTING AND VALUATION	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVES

- To understand the concepts types of estimation and types of contracts with valuation.
- To know about the rate analysis and bill preparations and to study about the specification writing.

UNIT 1 ESTIMATION

9 Hrs.

Introduction - Purpose - Methods of estimation - Types of estimates - Approximate estimates - Detailed estimate - Estimation of quantities for buildings, roads, canals and hydraulic structures - field study.

UNIT 2 RATE ANALYSIS AND COSTING

9 Hrs.

Standard Data - Rate analysis for earthwork, concrete works, D. P. C., Brickwork, stone masonry, plastering, pointing, road work, carriage of materials. - Schedule of rates - costing - cost control - construction, machineries - Tools and techniques.

UNIT 3 SPECIFICATIONS AND TENDERS

9 Hrs.

Detailed and general specification - types of specification - Tender notices - types - tender procedures Drafting model Tenders.

UNIT 4 CONTRACTS

9 Hrs.

Contract - Types of contracts - Formation of contract - Contract conditions - Contract for labour, material Earnest Money Deposit, Security Deposit, Measurement Book - Contract problems - Arbitration - ISO documentation.

UNIT 5 VALUATION

9 Hrs.

Introduction - Types of valuation - Common terms used in valuation - Valuation methods - Valuation of land Buildings, Fixation of rent - problem - depreciation - mortgage - case study.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, students will be able to

- CO1 - Calculate the detailed estimate for Buildings, roads and hydraulic structures
- CO2 - Analyze the cost and its controlling in construction activities.
- CO3 - Prepare detailed specifications and tender documents for civil engineering projects.
- CO4 - Prepare contract document for civil engineering projects.
- CO5 - Value the land and buildings using various methods.
- CO6 - Conduct a case study on valuation, depreciation and mortgage of buildings.

SCIA1703	PRESTRESSED CONCRETE STRUCTURES	L	T	P	Credits	Total Marks
		3	*	0	3	100

COURSE OBJECTIVE

- To impart the knowledge about design of pre stressed concrete members.

UNIT 1 INTRODUCTION – THEORY AND BEHAVIOUR

9 Hrs.

Basic Concepts - Advantages - Material Required - Systems and **Methods of Prestressing** - Analysis of Sections by Stress Concepts, Strength concept and Load Balancing Concept - Losses due to Prestressing.

UNIT 2 DESIGN FOR FLEXURE

9 Hrs.

Definition of Type I, II & III Structures - Basic assumptions - Permissible stresses in steel and concrete as per IS : 1343 - **Design of Rectangular, I & T section** - Ultimate strength based on IS : 1343 - 1980.

UNIT 3 DEFLECTION

9 Hrs.

Short term deflection of uncracked members - Long term deflection - Deflection due to creep - **Code requirements of limit state deflection.**

UNIT 4 TRANSFER OF PRESTRESS AND INDETERMINATE STRUCTURES

9 Hrs.

Anchorage Zone - Stresses in post tensioned members - Calculation of bearing stress and bursting tensile forces & reinforcement in anchorage zones based on IS : 1343 method. Methods of achieving continuity - Assumptions in Elastic analysis - Continuous beams - Linear transformation- Concordant cables.

UNIT 5 MISCELLANEOUS STRUCTURES

9 Hrs.

Design of tension and compression members - Tanks, pipes and poles - Partial prestressing - Definition, methods of achieving partial prestressing, merits and demerits of partial prestressing- **Composite Construction – methods, design principles, IS specifications** - Analysis of Stresses, Check for deflection, Flexural and Shear strength of Composite members

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, students will be able to

- CO1 - Determine the basic properties of prestressed concrete materials and methods of prestressing
- CO2 - Design prestressed concrete beams to resist bending and shear
- CO3 - Determine the short term and long-term deflections in prestressed beams.
- CO4 - Evaluate the bursting tensile forces and reinforcement in anchorage zones
- CO5 - Determine the pressure line in continuous beam
- CO6 - Design of prestressed Tension and compression of members

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 10 Questions of 2 marks each - No choice

20 Marks

PART B: 2 Questions from each unit of internal choice; each carrying 16 marks

80 Marks

SCIA1704	CONSTRUCTION MANAGEMENT	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To impart the idea about planning and scheduling of construction activities.

UNIT 1 CONSTRUCTION PROJECT FORMULATION

9 Hrs.

Introduction to project- types of construction project- project organization- characteristics of project- **project life cycle** - Feasibility Study of project-Introduction to time value of money- Net present value- Benefit cost ratio- Internal Rate of Return- Payback period-Role of project managers

UNIT 2 PROJECT PLANNING AND SCHEDULING

9 Hrs.

Introduction -Defining Work tasks-Precedence relationship among activities-Basic concepts of network analysis - CPM and PERT - **Use of CPM and PERT Techniques** Problems, and prospects and applications of CPM and PERT - Crashing and Time / Cost Trade - off problems

UNIT 3 QUALITY AND SAFETY MANAGEMENT IN CONSTRUCTION

9 Hrs.

Introduction to quality - Importance - Types - Inspection - Control and enforcement-Tools and techniques for quality management - Inspection of materials and machinery - Quality audits-Statistical quality control - Tools - Control chart -- Site management with regard to safety

UNIT 4 CONSTRUCTION CONTRACTS

9 Hrs.

Indian Contracts Act - Elements of Contracts - Types of Contracts - Features - Suitability - Design of Contract Documents - International Contract Document - Standard Contract Document-Arbitration-Appointment of Arbitrators - Conditions of Arbitration - Powers and Duties of Arbitrator

UNIT 5 APPLICATION OF OPERATION RESEARCH TECHNIQUES IN CONSTRUCTION

9 Hrs.

Introduction -concepts in probability and statistics-linear programming by Graphical Method-Different types of LPP Solution-Transportation Problems- Assignment problems-Simulation Techniques- Introduction to Monte Carlo Method simulation-functions of random variables

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, students will be able to

- CO1 - Apply different aspects of project management in construction.
- CO2 - Develop project planning, organizing, budgeting and controlling skills.
- CO3 - Formulate feasible projects based on preliminary analyses
- CO4 - Estimate the project duration and total cost using network analysis.
- CO5 - Apply softwares for construction project management and database information system.
- CO6 - Create a simulation model for a construction project using spreadsheet.

SCIA3015	QUALITY CONTROL AND SAFETY MANAGEMENT	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVES

- To study the concepts of quality assurance and control techniques in construction.
- To develop conceptual understanding on quality control methods.
- To understand the various safety programmes to follow in construction site.
- To know the contractual obligations of safety practices in construction site.

UNIT 1 QUALITY MANAGEMENT AND SYSTEMS

9 Hrs.

Introduction – Definitions and objectives – Factors influencing construction quality – Responsibilities and authority – Quality plan – Quality Management Guidelines – Quality circles - Quality system standard – ISO 9000 family of standards – Requirements – Preparing Quality System Documents – Quality related training – Implementing a Quality system – Third party Certification.

UNIT 2 QUALITY POLICY

9 Hrs.

Quality policy – Objectives and methods In Construction Industry – Consumers satisfaction, Economics -Time of Completion – Statistical tolerance -Taguchi's concept of quality – Codes and Standards – Documents – Contract and construction programming – Inspection procedures – Processes and products – Total QA I QC program and cost implication.

UNIT 3 QUALITY ASSURANCE AND QUALITY CONTROL

9 Hrs.

Objectives – Regularity agent, owner, design, contract and construction oriented objectives, methods -Techniques and needs of QA/QC -Different aspects of quality – Appraisals, Factors Influencing construction quality.

UNIT 4 SAFETY AND FAILURE ASPECT IN CONSTRUCTION

9 Hrs.

Construction accidents- human factors in construction safety- safety programmes-job site safety assessment- safety meeting- safety incentives-owners responsibility for safety- Role of designer for ensuring safety

UNIT 5 CONTRACTUAL OBLIGATIONS

9 Hrs.

Safety in Construction Contracts – Substance Abuse – Safety Record Keeping-Hazard identifications and control techniques - HAZOP, FMEA, FMECA - Cost of Construction Injuries - Legal Implications Compensation - basics and types.

Max. 45 Hrs.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Understand the quality control aspects in planning, systems and management. CO2
- Apply the concepts of quality control methods.
- CO3 - Know the assurance and improvement techniques used in construction. CO4
- Identifying the sources and causes of accidents in construction site.
- CO5 - Understanding the contractual obligations of safety practices

SCIB2201	BUILDING PLANNING AND DRAWING LAB	L	T	P	EL	Credits	Total Marks
		0	0	4	0	2	100

COURSE OBJECTIVE

- To learn computer aided drafting software along with manual drafting for building planning and drawing
- To draft the various components of buildings like doors, stair case, trusses and footing
- To draft the plan, elevation and section of various buildings
- To prepare approval drawing as per building bye laws and regulations

SUGGESTED LIST OF EXPERIMENTS

A. MANUAL DRAFTING

1. Plan and Elevation section of various types of staircase
2. Plan, Elevation and Section of Primary Health Centre (Hospital).
3. Plan, Elevation and Section of School Building.
4. Elevation of Queen Post Truss
5. Approval drawing of a two storied Residential Building.

B. COMPUTER AIDED DRAFTING

1. Elevation of Panelled Door
2. Elevation of King Post Truss
3. Elevation of Stepped Wall footing
4. Plan, Elevation and Section of Semidetached house
5. Plan, Elevation and Section of a cottage building

COURSE OUTCOMES

On completion of the course, student will be able to

CO1 – Apply the concepts of planning and specifications for buildings as per National building code

CO2 – Adopt the various drafting and editing tools of Computer aided drafting software.

CO3 - Draft the plan, elevation and section of residential buildings using Minidrafter and software.

CO4 - Model the various components of buildings like door, trusses and footing using computer aided drafting software.

CO5 - Draft the plan, elevation and section of commercial building like cottages using software

CO6 - Draft the plan, elevation and section of institutional buildings like schools and hospitals using Minidrafter

Employability

Entrepreneurship

Skill Development

SCIA2301	SURVEYING LAB - I	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To understand the method of using surveying instrument for various civil engineering purpose.

SUGGESTED LIST OF EXPERIMENTS

1. Determination of area of polygon by base line method using chain survey.
2. Setting out foundation marking of a double room building by offset method using chain survey
3. Determination of area by traversing using plane table survey.
4. Calculate the reduced level of points by rise and fall method and height of collimation method using dumpy level
5. Longitudinal and Cross Sectional leveling of a given road segment using dumpy level.
6. Determination of elevation of an object using single plane method when base is inaccessible.
7. Determination of distance and difference in elevation between two inaccessible points using double plane method.
8. Measurement of horizontal distance and vertical height with angle of elevation/depression with staff held vertical. (Stadia Tacheometry)
9. Measurement of horizontal distance and vertical height with angle of elevation /depression with staff held vertical. (Tangential Tacheometry).
10. Setting out simple curve using offsets from long chord using theodolite.
11. Setting out simple curve using Single Theodolite method (Rankin's Method)
12. Setting out simple curve using Double Theodolite method

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Evaluate the area of land using suitable survey equipment
- CO2 - Invent the distance between inaccessible points using survey equipment
- CO3 - Develop an area map after locating the survey instrument station.
- CO4 - Detect the variation in the levels of different points with respect to a reference bench mark
- CO5 - Build a horizontal curve with suitable survey equipment
- CO6 - Measure the area and the reduced levels of a selected field using suitable survey equipment

Employability

Entrepreneurship

Skill Development

SCIA2302	STRENGTH OF MATERIALS LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To expose the students to the testing of different materials under the action of various forces and determination of their characteristics experimentally.

SUGGESTED LIST OF EXPERIMENTS

1. By conducting tension test, draw the stress-strain curve on mild steel.
2. Compression Test on bricks and Wood.
3. Deflection Test on mild steel beam - Verification of Maxwell theorem
4. Deflection Test on Aluminium beam - Verification of Maxwell theorem
5. Tension Test on closed coiled helical springs.
6. Compression Test on open coiled helical springs.
7. Impact test on metal specimen using a Charpy/Izod method.
8. Shear test on metal specimen by using U.T.M.
9. Hardness values of Steel, Copper and Aluminum by using Brinell hardness testing machine.
10. Hardness values of Steel, Copper and Aluminum by using Rockwell hardness testing machine.
11. Hardness values of Steel, Copper and Aluminum by using Vicker's hardness testing machines.
12. Torsion test on metal specimen by using Torsion Testing Machine.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Analyze stress strain curve of mild steel, thin wire and twisted rod.
- CO2 - Determine the hardness of aluminum, brass, steel and copper.
- CO3- Conduct deflection test on beam based on Maxwell theorem.
- CO4 - Conduct tension and compression test on springs.
- CO5 - Determine the compressive strength of brick and concrete blocks.
- CO6 - Determine the shear strength and toughness of steel.

Employability

Entrepreneurship

Skill Development

SCIA2401	SURVEYING LAB - II	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To understand the method of using surveying instrument for various civil engineering purpose.

SUGGESTED LIST OF EXPERIMENTS

1. Determine the tacheometric constant.
2. Determining the tacheometric contouring - Rectangular method
3. Determining the tacheometric contouring - Radial method
4. Longitudinal and cross sectional leveling of a given road segment using theodolite.
5. Horizontal and vertical distance using Total Station
6. Traversing and area calculation using Total Station
7. Slope distance using Total Station
8. Determining the area of a given boundary using GPS Surveying (Co-ordinate Measurements)
9. Astronomical survey - Demonstration on Azimuth of a survey line by observations on the sun.
10. Import and Export of data from Auto-cad to Total Station with software interpretation.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Evaluate the horizontal and vertical distance of elevated objects using suitable survey equipment.
- CO2 - Invent the reduced level of elevated and depressed objects using suitable survey equipment..
- CO3 - Develop contour lines of a selected field using suitable survey equipment
- CO4 - Invent the enclosed area of a larger field using total station
- CO5 - Assess the exact locational coordinates of given points using GPS survey.
- CO6 - Evaluate the sloping distance between two objects using Total station

Employability

Entrepreneurship

Skill Development

SCIA2402	HYDRAULIC ENGINEERING LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- Students should be able to verify the principles studied in theory by performing the experiments in lab.

SUGGESTED LIST OF EXPERIMENTS

A) Flow Measurement

1. Determination of coefficient of flow through Venturimeter
2. Determination of coefficient of flow through Orificemeter
3. Determination of coefficient of flow through Orifice and Mouthpiece -Constant and variable head method.
4. Determination of coefficient of flow through Notches (Vnotch)

B) Losses in Pipes

5. Determination of friction coefficient in pipes
6. Determination of Manning's and Chezy's coefficients

C) Determination of Metacentric height

7. Determination of Meta centrich eight of ship model (Warship/Cargoship)

D) Pumps

8. Characteristics test on a Reciprocating pump
9. Characteristics test on Centrifugal pump.
10. Characteristics test on multistage Centrifugal pump.
11. Characteristics test on Submersible pump
12. Characteristics test on Gear oil pump

E) Turbines

13. Load test on Pelton wheel turbine
14. Load test on Francis turbine
15. Load test on Kaplan turbine

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Explore the basic and fundamentals in fluid flow principles
- CO2 - Determine the discharge characteristics of flow through pipes
- CO3 - Determine the discharge characteristics of flow through channels
- CO4 - Analyze the static stability of floating bodies (Metacentric height)
- CO5 - Analyze a variety of practical fluid-flow devices and application
- CO6- Assess the efficiency of pumps and turbines

SCIA2501	SOIL MECHANICS LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVES

- To learn about the lab tests and field tests for soil for various civil engineering purposes.
- To understand the basic physical and mechanical properties of soil.
- To gain necessary skill to perform standard field and laboratory tests.

SUGGESTED LIST OF EXPERIMENTS

1. Determination of Specific gravity of soil
2. Determination of Sieve analysis for Coarse-grained soil
3. Determination of Hydrometer analysis for Fine-grained soil
4. Determination of Liquid Limit and Plastic limit
5. Determination of Shrinkage limit
6. Determination of Standard Proctor Compaction test
7. Determination of Field density of soil by Core Cutter method
8. Determination of Field density of soil by Sand Replacement method
9. Determination of permeability of soil by constant head method
10. Determination of permeability of soil by variable head method
11. Determination of compressibility characteristics
12. Determination of shear parameter by Direct Shear test on sand
13. Determination of shear parameter by Unconfined Compression test for cohesive soil
14. Determination of shear parameter by Triaxial Compression test for cohesive soil
15. Determination of shear parameter by Vane shear test.

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the physical properties for characterization of soil
- CO2 - Assess the consistency limits of soil.
- CO3 - Compute the field density of soil using different method.
- CO4 - Determine the permeability of soil using constant and variable head method.
- CO5 - Assess the compressibility of soil using consolidation method
- CO6 - Evaluate the shear parameters of soil by different shear tests.

SCIA2502	ENVIRONMENTAL ENGINEERING LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVES

- To analyze the physical, chemical and biological characteristics of water and wastewater.
- To quantify the dosage requirement for coagulation process.

SUGGESTED LIST OF EXPERIMENTS

1. Determination of pH
2. Determination of Conductivity
3. Determination of Alkalinity
4. Determination of Chlorides (Mohr's method)
5. Determination of Hardness (EDTA method)
6. Determination of Turbidity (NTU)
7. Determination of Total Solids
8. Determination of Total Dissolved Solids
9. Determination of Residual Chlorine
10. Determination of Optimum dosage of Coagulant (Jar Test)
11. Determination of Dissolved Oxygen (Winkler method)
12. Determination of Biochemical Oxygen Demand (BOD₅)
13. Determination of Chemical Oxygen Demand (COD)
14. Determination of Total Organic Carbon (TOC)
15. Determination of colour and odour of water sample
16. Air quality monitoring (ambient, stack monitoring, indoor air pollution)

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine physical, chemical and biological characteristics of water
- CO2 - Determine optimum dosage of coagulant
- CO3 - Analyze the survival conditions for the microorganism and its growth rate.
- CO4 - Characterize water and conduct treatment studies.
- CO5 - Assess the quality of water
- CO6 - Recommend the degree of treatment required for the water

Employability

Entrepreneurship

Skill Development

SCIA2601	CONCRETE TECHNOLOGY LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To understand and perform various tests on cement, aggregates and concrete.

SUGGESTED LIST OF EXPERIMENTS

A) Tests on Cement

1. Standard consistency of cement
2. Initial and final setting time of cement
3. Compressive strength of cement
4. Fineness of cement

B) Tests on Aggregates (Fine Aggregate & Coarse Aggregate)

1. Particle size distribution
2. Fineness modulus, bulk density, void ratio
3. Bulking of fine aggregate
4. Specific gravity of aggregate
5. Impact Value
6. Crushing Strength

C) Tests on Fresh Concrete

1. Mix design
2. Slump test
3. Compaction factor test
4. Flow test

D) Tests on Hardened Concrete

1. Compressive strength of concrete
2. Flexural strength of concrete
3. Split tensile strength of concrete
4. Rebound hammer test

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Determine the properties and strength of a given cement sample.
- CO2 - Classify the zone of the given fine aggregate sample based on sieve analysis.
- CO3 - Determine the physical properties and strength of the given coarse and fine aggregates samples.
- CO4 - Proportionate the ingredients of concrete of any grade using Indian Standard method of mix design.
- CO5 - Determine the workability properties of a fresh concrete for a given mix proportion.
- CO6 - Determine the mechanical properties of the given concrete sample.

Employability

Entrepreneurship

Skill Development

SCIA2602	HIGHWAY ENGINEERING LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To provide the students to hands on experience on the various testing procedures of pavement materials as per the IRC standards.

SUGGESTED LIST OF EXPERIMENTS

A) Test on Aggregate

1. Shape test
2. Los Angeles Abrasion test

B) Test on Bitumen

3. Penetration Test on Bitumen
4. Ductility test on bitumen
5. Softening point test on bitumen / tar
6. Flash and fire point test on bitumen - tar bitumen
7. Specific gravity test
8. Viscosity test on tar
9. Stripping test
10. Optimum Bitumen Content in bituminous mix by cold solvent extraction method – Demonstration

C) Test on Mix Design

11. Marshall Stability Test for bitumen with design consideration

D) Test on Subgrade Soil

12. California Bearing Ratio Test

E) Test on Pavement Evaluation

13. Benkelman Beam Method

COURSE OUTCOMES

On completion of the course, student will be able to

- CO1 - Assess the quality of aggregates used in road construction
- CO2 - Predict the grade of bitumen by conducting Penetration and Viscosity test
- CO3 - Analyze the quality of bitumen using Softening Point, Flash and Fire Point and Ductility test
- CO4 - Determine the optimum bitumen content required for Bituminous Road mixes
- CO5 - Determine the bearing capacity of subgrade soil using California Bearing Ratio test
- CO6 - Understand the concept of Benkelmann Beam deflection for strengthening of pavements

Employability

Entrepreneurship

Skill Development

SCIA2701	COMPUTER AIDED ANALYSIS AND DESIGN OF STRUCTURAL ELEMENTS LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- The overall idea of implementing this course is to prepare detailing drawings using AUTOCAD software
- To design steel and reinforced concrete structural elements using Staadpro software.

SUGGESTED LIST OF EXERCISES

A) AutoCADD

Introduction to AutoCADD Commands

1. Foundation Reinforcement Detailing
2. Flat Slab Reinforcement Detailing

B) STAAD.Pro

Introduction to STAAD - Pro., STAAD - Pre creation of input files by using the Text Editor and Graphical input Generator, STAAD - Post Graphical Post processing, Viewing and Printing the output files.

1. Analysis and Design of Continuous beam with fixed at both ends
2. Analysis and Design of Continuous beam with simply supported ends
3. Analysis and Design of Continuous beam with over hangings
4. Analysis and Design of Propped cantilever beam with different materials
5. Analysis and Design of Continuous beam with member moment
6. Analysis and Design of Plane frames
7. Analysis and Design of Trusses

COURSE OUTCOME

On completion of the course, students will be able to

CO1 - Draft the reinforcement detailing of various reinforced concrete elements like foundations, pile cap, beam, slab, beam-column joints and staircase using AUTOCAD software.

CO2 - Design cantilever and continuous beams based on all types of support conditions using staad.pro software

CO3 - Design the five types of portal frames using staad.pro software..

CO4 - Design any type of steel roof truss using staad.pro software.

CO5 - Design a G+2 Reinforced concrete building using staad.pro software.

CO6 - Design a G+2 Steel building using staad.pro software.

S38BPB11	ADVANCED REINFORCED CONCRETE STRUCTURES	L	T	P	EL	Credits	Total Marks
		3	0	2	0	4	100

COURSE OBJECTIVE

- To make the students be familiar with the limit state design of advanced reinforced concrete structures
- To design special structures like Shear walls, Bunkers, Silos, flat slabs, grid floor, corbel and deep beams
- To execute a project on modeling, analyzing and designing a special structure.

UNIT 1 LIMIT STATE DESIGN OF BEAMS FOR FLEXURE

9Hrs.

Review of Basic Concepts - Behaviour and Design of Reinforced Concrete members considering flexure, Torsion, combined with flexure and flexural shear, deflection and crack width as per IS456.

UNIT 2 DESIGN OF SHEAR WALLS AND DEEP BEAMS

9Hrs.

Shear walls – Types of shear walls – Design of shear walls. Simply Supported and Continuous Deep beams.

UNIT 3 DESIGN OF SPECIAL RCC MEMBERS

9Hrs.

Flat slabs, Flat plates, Grid floor and Corbel.

UNIT 4 BUNKERS AND SILOS

9Hrs.

Introduction to Limit state design of Bunkers and Silos - Rectangular and Circular types.

UNIT 5 DESIGN PROJECT

9Hrs.

Seismic Behavior and Design of RC Shear Walls - Influence of orientation of shear walls on structural behavior of RC buildings - Design of flat slab for a commercial building - comparison of structural behavior of conventional roof and flat slab system - Design of a deep beam for an aesthetic building

Max.45Hrs.

COURSE OUTCOMES

At the end of the course, student will be able to:

- CO 1 - Design reinforced concrete beams for bending, shear and torsion by Limit State Design method
- CO 2 - Design shear walls and deep beams
- CO 3 –Design the flat slabs, grid floor and corbel.
- CO 4 –Design storage structures like bunkers and silos
- CO 5 - Utilize computer applications for designing RC structures and its components
- CO 6 – Execute a design project using analysis and design software.

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks:100

Exam Duration: 3Hrs.

PART A: 5 Questions of 6 Marks each–No choice

30 Marks

PART B: 2 Questions from each unit of internal choice each carrying 14 Marks

70 Marks

 Employability

 Entrepreneurship

 Skill Development

SCIB5203	ADVANCED DESIGN OF STEEL STRUCTURES	L	T	P	EL	Credits	Total Marks
		3	0	0	1	3	100

COURSE OBJECTIVES

- To learn the various modes of structural connections between a beam and a column.
- To conduct plastic design of beams and frames
- To design the components of pre-engineered building and tall structures
- To design cold formed steel column and beams

UNIT 1 STRUCTURAL CONNECTIONS

9Hrs.

Types of connections- Bolted and welded connections – Seated Connections – Unstiffened and Stiffened – Moment Resistant Connections – Clip angle Connections – Split beam Connections – Framed Connections – Introduction to Tekla software, Basic 3D Modeling, System Components, Interactive Modeling & Building Custom Components, Modeling Techniques, Structural Profiles and Materials, Numbering and reports, Principles of working with drawings.

UNIT 2 PLASTIC ANALYSIS OF STRUCTURES

9Hrs.

Introduction, Shape factor, classification of section, elastic and plastic section moduli - Combined mechanisms, Analysis of portal frames, Effect of axial force - Effect of shear force on plastic moment– Design of continuous beams. -

UNIT 3 PRE ENGINEERED INDUSTRIAL BUILDING

9Hrs.

Design of gantry girder subjected to lateral loads and axial loads, Analysis and design of roof truss, Design of Purlins- wind pressure

UNIT 4 ANALYSIS AND DESIGN OF SPECIAL STRUCTURES

9Hrs.

Design of self supporting chimney and guyed steel stacks- Stresses due to wind and earthquake forces – Design of foundation –Gust factor method. Towers- Basic structural configurations – free standing and guyed towers – loads on towers– wind loads – foundation design.

UNIT 5 DESIGN OF COLD FORMED STEEL STRUCTURES

9Hrs.

Behaviour of Compression Elements - Effective width for load and deflection determination – Behaviour of Unstiffened and Stiffened Elements – Design of webs of beams – Flexural members – Lateral buckling of beams – Shear Lag – Flange Curling – Design of Compression Members – Wall Studs.

Max.45Hrs.

Course Outcomes

At the end of the course, student will be able to:

- CO1 - Design the connections of steel beam and column joint
- CO2 – Conduct plastic analysis for beams and frames
- CO3 - Design the components of pre-engineered building
- CO4 – Design tall structures like chimney and towers
- CO5 – Understand code provisions and properties of light gauge steel sections
- CO6 - Design the beams and columns using cold formed steel sections.

S38BLH31	SEISMIC DESIGN OF STRUCTURES	L	T	P	EL	Credits	Total Marks
		3	0	2	1	4	100

COURSE OBJECTIVES

- To study the effect of earthquakes, analysis and design of earthquake resistant Structures.
- To learn the design concepts and cyclic load behavior of RCC, Steel and prestressed concrete elements
- To design buildings for seismic using software packages

UNIT 1 INTRODUCTION

9 Hrs.

Elements of Engineering Seismology–Theory of vibrations Response Spectrum. Seismotectonics and Seismic Zoning of India, Earthquake Monitoring and Seismic Instrumentation, Characteristics of Strong Earthquake Motion, Estimation of Earthquake Parameters.

UNIT 2 EARTHQUAKE HISTORY

9Hrs.

Indian Seismicity–Earthquake History– Earthquake occurrence in the world-causes of earthquake. Behaviour of structures in the past Earthquakes.

UNIT 3 DESIGN CONCEPT AND BEHAVIOR OF STRUCTURES

9Hrs.

Philosophy and Principle of Earthquake Resistant Design, Guidelines for Earthquake Resistant Design Seismic Design Concepts – Cyclic load behaviour of RCC, Steel and Pre-stressed Concrete Elements – Designs Spectrum – Principles of capacity design.

UNIT 4 FRAME SAND SHEARWALLS

9Hrs.

Provisions of Seismic Code (IS 1893) – Building systems frames, Shear Wall, Braced frames, combinations – Torsion. Design and Detailing of Frames–Shear Walls and Frame Walls.

UNIT 5 COMPUTATIONAL ANALYSIS, MODERN CONCEPTS

9 Hrs.

Performance of Regular buildings 3D Computer Analysis of building Systems (Theory only) – Structural Configuration–Seismic performance–Irregular Buildings–Soil performance, Modern Concepts–Base Isolation – Adoptive systems–Case Studies.

Max.45Hrs.

SUGGESTED LIST OF EXERCISES

Carry out the Seismic analysis and design of RCC structures & Steel structures (singlestorey & Multistorey buildings)

COURSE OUTCOMES

At the end of the course, student will be able to:

- CO1 – Construct design spectrum, site specific, probabilistic and uniform hazard spectrums.
- CO2 - Understanding of earthquake hazards: sources, magnitude, seismic intensity and site effects
- CO3 – Utilize various IS Codal provisions for seismic design
- CO4 – Understand the principles of performance based seismic design, failure mode control and capacity design
- CO5 – Design RC shear wall frame systems
- CO6 – Design buildings for seismic using various software packages.

Skill Development

SCIB7001	MATRIX METHOD OF STRUCTURAL ANALYSIS	L	T	P	EL	Credits	Total Marks
		3	0	0	0	3	100

COURSE OBJECTIVE

- To learn about Stiffness, flexibility and energy concepts.
- Learn to represent structural systems using matrices, including the stiffness matrix and the flexibility matrix.
- Learn to formulate the element equations for different types of structural elements, such as beams, trusses, and frames, using the matrix method.

UNIT 1 FUNDAMENTAL CONCEPTS OF STRUCTURES

9 Hrs.

Introduction -Types of Matrices – Matrix addition, Matrix multiplication, Inverse of a matrix of fourth order – Force and Displacement measurements - **Force and Displacement Methods of Structural Analysis**- Principles of superposition.

CHARACTERISTICS OF STRUCTURES – STIFFNESS AND FLEXIBILITY

Introduction to Equilibrium – Structures with single coordinate – Two coordinates – Stiffness and flexibility matrices in coordinates – Stiffness and flexibility matrices in constrained measurements

UNIT 2 ENERGY CONCEPTS IN STRUCTURES

9 Hrs.

Strain energy in terms of stiffness and flexibility matrices – Properties of stiffness and flexibility matrices – Interpretation of coefficients - Betti's Law – Other energy theorems - using matrix notations.

UNIT 3 TRANSFORMATION OF INFORMATION

9 Hrs.

Indeterminate Structures – Transformation of System force to element forces – Element Flexibility to System Flexibility – System Displacement to Element Displacement - Stiffness and Flexibility matrices of the elements- Normal coordinates and orthogonal Transformation.

UNIT 4 FLEXIBILITY METHOD

9 Hrs.

Statically Determinate and Indeterminate Structures – Choice of redundants leading to ill and well conditioned matrices – Automatic choice of redundant – Rank technique – Transformation to one set of redundant to another – Internal forces due to thermal expansion and lack of fit – Reducing the size of flexibility matrix – Application to pin- jointed plane truss – Continuous beams – Frames – Grids.

UNIT 5 STIFFNESS METHOD

9 Hrs.

Introduction – Development of the stiffness method – Analogy between flexibility and stiffness – Analysis due to thermal expansion - lack of fit – **Application of stiffness approach to pin jointed plane and space trusses** – Continuous beams – Frames.

Max. 45 Hrs.

Course Outcomes

At the end of the course, student will be able to:

CO 1 - Understand the basic concept of Matrix related to structural analysis

CO 2 - Analyze structural members using strain energy concepts.

CO 3 - Convert element flexibility in to system flexibility and element stiffness matrix into system stiffness matrix for indeterminate structures.

CO 5 – Analyze determinate structures using flexibility matrix method.

CO 5 - Analyze indeterminate structures using flexibility matrix method.

CO 6 - Analyze indeterminate structures using stiffness matrix method.

SCIB7003	ADVANCED CONCRETE TECHNOLOGY	L	T	P	EL	Credits	Total Marks
		3	0	0	0	3	100

COURSE OBJECTIVE

- To provide students with a comprehensive understanding of the properties and behavior of concrete.
- To equip students with the skills to develop advanced concrete mix designs.
- To explore advanced concrete technologies that promote environmental friendliness and resource efficiency.

UNIT 1 CONCRETE MAKING MATERIALS

9Hrs.

Aggregates classification, IS Specifications, Properties, Grading, Methods of combining aggregates, specified gradings, Testing of aggregates. Cement, Grade of cement, Chemical composition, Testing of concrete, Hydration of cement, Structure of hydrated cement, special cements. Water Chemical admixtures, Mineral admixture.

UNIT 2 CONCRETE

9Hrs.

Properties of fresh concrete, Hardened concrete, Strength, Elastic properties, Creep and shrinkage, Variability of concrete strength, durability of concrete.

UNIT 3 MIX DESIGN

9Hrs.

Principles of concrete mix design, Methods of concrete mix design, testing of Concrete. Statistical quality control-sampling and acceptance criteria.

UNIT4 SPECIAL CONCRETE

9Hrs.

Light weight concrete, Fly ash concrete, Fibre reinforced concrete, Sulphur impregnated concrete, Polymer Concrete, Super plasticised concrete, hyper plasticized concrete, Epoxy resins and screeds for rehabilitation - properties and applications - high performance concrete. High performance fiber reinforced concrete, self- compacting-concrete.

UNIT 5 CONCRETING METHODS

9Hrs.

Process of manufacturing of concrete, methods of transportation, placing and curing. Extreme weather concreting, special concreting methods. Vacuum dewatering - underwater concrete, special form work.

Max.45Hrs.

COURSE OUTCOME

On the end of the course, student will be able to:

- CO 1 - Understand the properties of different concrete materials.
- CO 2 - Determine the properties of fresh and hardened concrete.
- CO 3 - Design the mix proportions of concrete as per Indian standards.
- CO 4 - Analyze the properties and applications of special concrete
- CO 5- Evaluate various methods of batching, mixing, and quality control during manufacturing.
- CO 6- Identify the challenges and considerations associated with concrete placement in extreme weather conditions

 Skill Development

SCIA7014	INDUSTRIAL STRUCTURES	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To study the requirements, planning and design of Industrial structures.

UNIT 1 PLANNING AND FUNCTIONAL REQUIREMENTS

9 Hrs.

Classification of Industries and industrial structures - planning for layout requirements regarding Lightening, Ventilation and Fire safety - Protection against Noise and Vibration - Guidelines from Factories Act.

UNIT 2 INDUSTRIAL BUILDINGS

9 Hrs.

Components of Industrial Structure -Roofs for Industrial buildings - Design of Gantry girder - Design of Corbels.

UNIT 3 POWER PLANT STRUCTURES

9 Hrs.

Chimneys and Cooling Towers - high-pressure boilers and piping design - Nuclear Contaminant structures.

UNIT 4 POWER TRANSMISSION STRUCTURES

9 Hrs.

Cables - Transmission Line Towers - Substation structures - Tower foundations - Testing Towers.

UNIT 5 MACHINE FOUNDATIONS

9 Hrs.

Types - Design Principles - Foundation for Turbo generators.

Max. 45 Hrs.

Course Outcomes

At the end of the course, student will be able to:

- CO 1 - Discuss the planning and functional requirements of Industrial structures
- CO 2 - Discover the need to learn about the design concepts, and constructional aspects of Industrial structure
- CO 3 - Design of gantry girder, corbels and nibs
- CO 4 - Design of various structures such as bunkers, silos and chimney
- CO 5 - Knowledge about tower foundations
- CO 6 - Knowledge about foundation for turbo generators

END SEMESTER EXAMINATION QUESTION PAPER PATTERN

Max. Marks: 100

Exam Duration: 3 Hrs.

PART A: 5 Questions of 6 Marks each - No choice

30 Marks

PART B: 2 Questions from each unit of internal choice, each carrying 14 Marks

70 Marks

 Employability

 Entrepreneurship

 Skill Development

SCIB7009	DESIGN OF SUB STRUCTURES	L	T	P	EL	Credits	Total Marks
		3	0	0	1	3	100

COURSE OBJECTIVES

- To learn the various theoretical concepts to determine the bearing capacity of foundations
- To gain familiarity and design of different types of foundation like shallow foundations and deep foundations.
- To understand the concept of designing well, machine and special foundations.

UNIT 1 SITE INVESTIGATION, SELECTION OF FOUNDATION AND BEARING CAPACITY 9Hrs.

Objectives – Methods of exploration – Depth of exploration – Sample disturbance – Factors governing location and depth of foundation – Insitu testing of Soils – Plate load test – Geophysical methods – Selection of foundation – Bearing capacity of shallow foundations by Terzaghi's theory, Meyerhof's theory, and codal provisions – Bearing capacity of footing subjected to inclined and eccentric loading – problems – Types of shear failure – General principles of foundation design.

UNIT 2 DESIGN OF SHALLOW FOUNDATIONS 9Hrs.

Types of shallow foundations – General principles of design of reinforced concrete shallow foundations – Structural design of isolated and combine footing – Structural design of rafts by conventional method – Principles of design of buoyancy raft and basement (no design problems).

UNIT 3 PILE FOUNDATION 9 Hrs.

Pile foundations – Types – General principles of design – Estimation of load capacity of piles by static and dynamic formulae – Detailing of reinforcement as per IS 2911 – Design of pile caps – Settlement analysis of pile groups – Negative skin friction Pile load tests.

UNIT 4 WELL AND CAISSON FOUNDATIONS 9Hrs.

Well and caisson foundations – Structural elements of Caisson and Well foundations – Elements of well foundation – Forces acting on Caisson and well foundations – Design of individual components of Caisson and well foundation (only forces acting and design principles) – Sinking of well – Shifts and tilts in Well foundations Preventive measures.

UNIT 5 TOWER FOUNDATION 9Hrs.

Types of Foundations – Design of foundation for transmission towers.

Max.45Hrs.

COURSE OUTCOME

On the end of the course, student will be able to:

- CO1-Understand the procedures of site investigation and soil exploration methods
- CO2-Compute the bearing capacity of foundations, types of shear failure and general principles of design of foundation
- CO3-Understand the types and general principles of design of reinforced concrete shallow foundations, design of isolated, combined footing and Raft Foundation
- CO4-Estimate the Load carrying capacity of piles, Negative skin friction and Settlement of pile group, Design of Pile cap
- CO5-Comprehend the types, forces acting and the design principles of structural components of well and caisson foundations
- CO6-Compute the design of foundation for Transmission Towers

Max. Marks: 100

Exam Duration: 3Hrs.

PART A: 5 Questions of 6 Marks each – No choice

30 Marks

PART B: 2 Questions from each unit of internal choice, each carrying 14 Marks

70 Marks

 Employability

 Entrepreneurship

 Skill Development

SCIA7017	PREFABRICATED STRUCTURES	L	T	P	Credits	Total Marks
		3	0	0	3	100

COURSE OBJECTIVE

- To Study the design principles, analysis and design of elements.

UNIT 1 GENERAL PRINCIPLES OF FABRICATION

9 Hrs.

Comparison with monolithic construction - Types of prefabrication - site and plant prefabrication - Economy of prefabrication - Modular coordination - Standardization - Planning for Components of prefabricated structures - Disuniting of structures - Design of simple rectangular beams and I beams - Handling and erection stresses - Elimination of erection stresses - Beams, columns - Symmetrical frames.

UNIT 2 PREFABRICATED ELEMENTS

9 Hrs.

Roof and floor panels, ribbed floor panels - wall panels - footings - Joints for different structural connections - Effective sealing of joints for water proofing - Provisions for non-structural fastenings - Expansion joints in pre- cast construction.

UNIT 3 PRODUCTION TECHNOLOGY

9 Hrs.

Choice of production setup - Manufacturing methods - Stationary and mobile production - Planning of production setup - Storage of precast elements - Dimensional tolerances - Acceleration of concrete hardening.

UNIT 4 HOISTING TECHNOLOGY

9 Hrs.

Equipments for hoisting and erection - Techniques for erection of different types of members like Beams, Slabs, Wall panels and Columns - Vacuum lifting pads.

UNIT 5 MAINTENANCE

9 Hrs.

Designing and detailing of precast unit for factory structures - Purlins, Principal rafters, roof trusses, lattice girders, gable frames - Single span single storeyed frames - Single storeyed buildings - slabs, beams and columns.

Max. 45 Hrs.

Course Outcomes:

At the end of the course, student will be able to:

- CO 1 - Understand general principles of pre-fabrication.
- CO 2 - Plan simple buildings using various types of prefabricated elements.
- CO 3 - Design simple prefabricated elements
- CO 4 - Knowledge about types of connections and design of abnormal loads.
- CO 5 - Outline the various phases involved in precast/pre-fabricated technology
- CO 6 - Distinguish pre-engineered buildings from conventional units

 Skill Development

SCIB5201	STRUCTURAL DYNAMICS	L	T	P	EL	Credits	Total Marks
		3	0	0	0	3	100

COURSE OBJECTIVES

- To expose the students the principles and methods of dynamic analysis of structures.
- To learn the concepts of developing mathematical models representing real time problems of discrete and continuous vibratory systems
- To prepare them for designing the structures for wind, earthquake and other dynamic loads.

UNIT 1 INTRODUCTION TO STRUCTURAL DYNAMICS

9 Hrs.

Formulation of equation of motion by different methods – Single degree of freedom – Free vibration – Forced response to harmonic – Periodic and impulsive loads – Response to general dynamic loading – Effect of damping - Methods of evaluation of damping.

UNIT 2 MULTI-DEGREE-OF FREEDOM SYSTEMS

9 Hrs.

Formulation of MDOF equations of motion – Evaluation of structural property matrices – Analysis of vibration frequency of motion – orthogonality conditions – approximate methods of extraction of eigen values.

UNIT 3 DYNAMIC RESPONSE OF MDOF SYSTEMS

9 Hrs.

Normal co-ordinates – Mode super position technique – Numerical integration process.

UNIT 4 CONTINUOUS SYSTEMS

9 Hrs.

Modeling – Analysis of free and forced response of beams and bars.

UNIT 5 APPLICATIONS

9 Hrs.

Idealization and mathematical model of multistory building frames, towers, examples of wind, earthquake and impact excitations.

Max. 45 Hrs.

COURSE OUTCOME

On the end of the course, student will be able to:

- CO 1 - Apply knowledge of mathematics, science, and engineering by developing the equations of motion for vibratory systems and solving for the free and forced response.
- CO 2 - Apply knowledge of mathematics, science, and engineering by developing the equations of motion for multiple degrees of freedom systems.
- CO 3 - Illustrates the concepts of dynamic loading and to study the dynamic response of MDOF systems subjected to different types of dynamic loads.
- CO 4 - Develop mathematical models representing real time problems of discrete and continuous vibratory systems
- CO 5 - Apply dynamic analysis methods to practical problems in structural engineering and other disciplines
- CO 6 - Evaluate the dynamic susceptibility of structures and the limitations of modelling techniques.

S38BLH21	FINITE ELEMENT ANALYSIS	L	T	P	EL	Credits	Total Marks
		3	0	2	1	4	100

COURSE OBJECTIVES

- To study the basics of the Finite Element Technique, a numerical tool for the solution of different classes of problems.
- To learn the concept of meshing techniques for higher order elements and error evaluations
- To learn the concepts of analysing structures using dynamic equations for one dimensional problem

UNIT 1 INTRODUCTION

9 Hrs.

Boundary Value Problems – Approximate Solutions – Variational and Weighed Residual Methods – Ritz and Galerkin Formulations – Concept of Piecewise Approximation and Finite Element – Displacement and Shape Functions –Weak Formulation – Minimum Potential Energy – Generation of Stiffness Matrix and Load Vector.

UNIT 2 STRESS ANALYSIS

9 Hrs.

Two Dimensional problems – Plane Stress, Plane Strain and Axisymmetric Problems – Triangular and Quadrilateral Elements – Natural Coordinates – Isoparametric Formulation - Numerical Integration – Plate Bending and Shell Elements — Brick Elements – Elements for Fracture Analysis.

UNIT 3 MESHING AND SOLUTION PROBLEMS

9 Hrs.

Higher Order Elements – p and h Methods of Mesh Refinement – ill conditioned Elements – Discretisation Errors Auto and Adaptive Mesh Generation Techniques -Error Evaluation.

UNIT 4 NONLINEAR, VIBRATION AND THERMAL PROBLEMS

9 Hrs.

Material and Geometric Nonlinearity – Methods of Treatment – Consistent System Matrices – Dynamic Condensation – Eigen Value Extraction - thermal analysis.

UNIT 5 DYNAMIC ANALYSIS AND SOFTWARE APPLICATION

9 Hrs.

Dynamic equations – Consistent and lumped mass matrices - 1-D bar element - Formulation of element stiffness, mass and force matrices - Example problems. Natural frequencies - 1-D bar element - Formulation of element stiffness, mass matrices. Modeling and analysis using recent softwares.

SUGGESTED LIST OF EXERCISES

1. Analysis of Structures using Finite element Package – ANSYS.
2. Problem Formulation – input parameters – modeling – material properties – boundary conditions.
3. Mesh generation – Solution and post processing.
4. Modal Analysis, Buckling Analysis, Non-linear analysis, Non-linear material analysis and Contact Analysis of beam, column, beam-column, frames and plate elements.

Max.45Hrs.

COURSE OUTCOME

On the end of the course, student will be able to:

- CO 1 -Understand to apply the various types of approximate methods in Boundary value problems
- CO 2 - Analysis of stress using finite element concept for Two dimensional problems.
- CO 3 - Understand the concept of meshing techniques for higher order elements and error evaluations.
- CO 4 - Study of Non linear, vibration and thermal problems using finite element methods.
- CO 5 - Analysis of structures using dynamic equations for one dimensional problem.
- CO 6 - Formulation of element stiffness matrix and modeling analysis using recent software.

PART B: 2 Questions from each unit of internal choice, each carrying 14 Marks

70Marks

Employability

Entrepreneurship

Skill Development

SCIB7002	EXPERIMENTAL STRESS ANALYSIS AND TECHNIQUES	L	T	P	EL	Credits	Total Marks
		3	0	0	0	3	100

COURSE OBJECTIVES

- To learn the principles of measurements of static and dynamic response of structures and carryout the analysis of results.
- To gain knowledge on various destructive and non-destructive techniques
- To understand the importance of model analysis and its practical applications

UNIT 1 STRAIN MEASUREMENT

9 Hrs.

Methods of Measurement -Calibration-Load calibration of testing machines-I.S. Code provisions - Measurement system - Strain measurement - Strain gauges - Principle, Types, Performance, Uses - Strain Rosettes- Wheatstone Bridge- Photo elasticity- Principle, Application-Moire fringe- Electronic load cells-Proving rings.

UNIT 2 MEASUREMENT OF VIBRATION AND WIND FLOW

9 Hrs.

Measurement of Vibration- Vibration Galvanometers- Vibrometer-Characteristics of Structural vibration- Pressure gauges- Velocity transducers- Seismic transducers – Linear Variable Differential Transformer- Cathode ray oscilloscope – X Y Plotter- Wind Tunnels-Flow meters- Venturimeter- Digital Data Acquisition systems.

UNIT 3 DISTRESS MEASUREMENT AND CONTROL

9 Hrs.

Diagnosis of distress in structures-Cracks in structures-Formation of cracks- Types of cracks-Causes of cracks- Crack measurement- Monitoring and measurement of crack movement- Corrosion of reinforcement in RCC- Half cell-Construction and use-Damage assessment-Controlled blasting for demolition.

UNIT 4 N.D.T.METHODS

9 Hrs.

Load testing on structures-In situ load testing-Ultimate load testing-Rebound hammer-Principle and Applications- Limitations- Ultrasonic testing- Principles and Applications- Brittle coating- Principle and Applications- Stress coat- All Temp- Comparison of brittle coatings- Evaluation of the coating.

UNIT 5 MODEL ANALYSIS

9 Hrs.

Model laws- Laws of similitude-Model materials- Model testing- Necessity for Model analysis-Advantages- Applications- Types of similitude- Scale effect in Models- Indirect model study- Direct model study- Limitations of model investigations- Structural problems that may demand model studies- Usage of influence lines in model studies.

Max. 45 Hrs.

COURSE OUTCOMES

At the end of the course, student will be able to:

- CO1 - Understand the working principle of strain gauges.
- CO2 – Apply the theoretical concepts for the Measurement of strains
- CO3 - Perform the model analysis using different theorems.
- CO4 - Know the strategies of maintenance and repair
- CO5 - Assess the strength of existing structures using NDT
- CO6 - Understand the different patterns of Cracks

SCIA7003	MAINTENANCE AND REHABILITATION OF STRUCTURES	L	T	P	EL	Credits	Total Marks
		3	0	0	1	3	100

COURSE OBJECTIVE

- To understand the principles and techniques used for assessing the condition of structures.
- To explore different maintenance strategies and practices for extending the service life of structures.
- To study the repair and strengthening techniques of structural elements, such as beams, columns and slabs

UNIT 1 MAINTENANCE AND REPAIR STRATEGIES

9Hrs.

Maintenance, repair and rehabilitation, facets of maintenance and importance of maintenance, various aspects of inspection, Assessment procedures for evaluating damaged structures, causes of deterioration – Testing techniques, NDT, Rebound Hammer, types of failures in foundation, floors, roofs, walls etc., Safety evaluation of existing buildings.

UNIT 2 SERVICEABILITY AND DURABILITY OF CONCRETE

9Hrs.

Quality assurance for concrete construction, concrete properties strength, workability, permeability, thermal properties and cracking. Effects due to climate, temperature, chemicals, wear and erosion, design and construction errors, corrosion mechanism, effects of cover thickness and cracking of corrosion protection, corrosion inhibitors, corrosion resistant steels, coatings, cathodic protection.

UNIT 3 MATERIALS AND TECHNIQUES FOR REPAIR

9Hrs.

Special concrete and mortars, concrete chemicals, special elements for accelerated strength gain, expansive cement, polymer concrete, sulphur infiltrated concrete, Ferro-cement, fibre reinforced concrete, water-proofing materials, Admixtures. Polymer coating for rebars, vacuum concrete, gunite, shotcrete, Epoxy injection, Mortar repairs of cracks, Shoring & Underpinning.

UNIT 4 REPAIR OF STRUCTURES

9Hrs.

Repair of structures distressed due to Earthquake - Strengthening using FRP, Strengthening and Stabilization techniques for repair. Strengthening of bridge pier.

UNIT 5 NDT OF STEEL

9Hrs.

Correlating ASTM tensile test (or IS:1608) for rebar with chemical composition results with respect to IS:2062, use of digital thickness gauges and weld gauges, use of hardness testers – Correlation with fire damaged and virgin specimens simple surface NDT tests – Penetration tests, Magnetic particle tests, use of coating gauges for metallic and Non-Metallic coating and identification of details for corrosion (durability aspects) simple techniques in visual inspection of weldments.

Max.45Hrs.

COURSE OUTCOMES

On the end of the course, student will be able to:

- CO1 – Assess various types of structural deterioration and damage
- CO2 – Analyze the parameters influencing the serviceability and durability of concrete
- CO3 – Understand the materials and techniques for repair and rehabilitation of structures
- CO4 – Apply the strengthening and stabilization techniques adopted for different types of structural elements
- CO5 – Correlate the application of various Non-destructive testing of steel
- CO6 – Develop the plan and procedure for strengthening of existing deteriorated structures

SCIB7021	INDUSTRY 5.0 FOR STRUCTURAL ENGINEERS	L	T	P	EL	Credits	Total Marks
		3	0	0	0	3	100

COURSE OBJECTIVES

- To provide a comprehensive understanding of Industry 5.0 and its impact on structural engineering.
- To familiarize students with advanced tools, technologies, and practices in structural analysis and design within the context of Industry 5.0.
- To develop ethical awareness, professionalism, and a forward-looking mindset in the field of structural engineering in the era of Industry 5.0.

UNIT 1 INTRODUCTION TO INDUSTRY 5.0 AND ITS IMPACT ON STRUCTURAL ENGINEERING 9 Hrs.

Overview of Industry 5.0 and its key features - Role of structural engineers in Industry 5.0 - Integration of advanced technologies (AI, IoT, Robotics) in structural engineering - Digital transformation in structural design and analysis - Industry case studies on the application of Industry 5.0 in structural engineering

UNIT 2 ADVANCED STRUCTURAL ANALYSIS AND DESIGN TOOLS IN INDUSTRY 5.0 9 Hrs.

Application of artificial intelligence (AI) in structural analysis and design - Integration of Building Information Modeling (BIM) and Structural Analysis Software - Automated design optimization techniques - Performance-based design approaches in Industry 5.0 - Case studies on the use of advanced analysis and design tools

UNIT 3 COLLABORATIVE DESIGN AND CONSTRUCTION PRACTICES IN INDUSTRY 5.0 9 Hrs.

Collaborative design platforms and virtual collaboration tools - Digital twin technology and its applications in structural engineering - Real-time monitoring and control systems for construction projects - Integration of prefabrication and modular construction in Industry 5.0 - Industry case studies on collaborative design and construction practices

UNIT 4 SUSTAINABLE AND RESILIENT DESIGN IN INDUSTRY 5.0 9 Hrs.

Sustainable design principles and practices in Industry 5.0 - Resilient design strategies for structural engineering - Life-cycle assessment and green building certifications - Smart materials and their applications in sustainable design - Case studies on sustainable and resilient design in Industry 5.0

UNIT 5 ETHICS, PROFESSIONALISM, AND FUTURE TRENDS IN INDUSTRY 5.0 9 Hrs.

Ethical considerations in Industry 5.0 for structural engineers - Professional responsibilities and standards in the digital era - Emerging trends and future prospects in structural engineering - Continuous professional development and lifelong learning in Industry 5.0

COURSE OUTCOMES

- CO1 - Analyze and evaluate the implications of Industry 5.0 on structural engineering practice.
- CO2 - Apply advanced structural analysis and design tools to solve complex engineering problems.
- CO3 - Implement collaborative design and construction practices using virtual platforms and digital twin technology.
- CO4 - Incorporate sustainable and resilient design principles in structural engineering projects.
- CO5 - Demonstrate ethical behavior and professionalism in the field of structural engineering in Industry 5.0.
- CO6 - Adapt to future trends in the field of Structural Engineering

Max. 45 Hrs.

 Skill Development

SCIB6101	STRUCTURAL ANALYSIS LAB	L	T	P	EL	Credits	Total Marks
		0	0	4	0	2	100

COURSE OBJECTIVE

- To model the given structure in a structural analysis software like Staadpro.
- To analyze the modeled structure in a structural analysis software
- To design and optimize the given structure in a structural analysis software

SUGGESTED LIST OF EXERCISES

1. Carryout the analysis and design of RCC structures & Steel structures (single storey & Multi storey buildings).
2. Analysis of truss
3. Typical modeling of berthing structure(IS 4651)
4. P-delta analysis of G+12 building.
5. Bridge modeling
 - i) Modeling of road bridges (load calculation as per IRC)
 - ii) Modeling of railway bridges using load calculation as per IRS

Course Outcomes

The students will be able to

- CO1 - Apply dead, live and wind loads on the structure using the software.
- CO2 - Model railway and highway bridges using Staad.pro software
- CO3 - Incorporate design parameters from Indian Standard Codes into STAAD Pro
- CO4 - Analyze the RCC and Steel structures.
- CO5 - Design the single and multi-storey structures.
- CO6 - Generate various reports from the software.

SCIA6301	STRUCTURAL ENGINEERING LAB	L	T	P	Credits	Total Marks
		0	0	4	2	100

COURSE OBJECTIVE

- To learn about various tests on RC Beams and Steel Beams

SUGGESTED LIST OF EXPERIMENTS

1. Fabrication, casting and testing of simply supported reinforced concrete beam for Strength and deflection behavior.
2. Testing of simply supported steel beam for strength and deflection behavior.
3. Testing of Reinforcement using Mechanical and electrical strain gauges.
4. Bending test of steel Flat
5. Determination of Young's modulus of concrete
6. Determination of Tensile and flexural strength of concrete.
7. Determination of in-situ strength and quality of concrete using i) rebound hammer ii) Ultrasonic Pulse Velocity Tester
8. Torsion on open and closed sections
9. Lateral torsional buckling of beams.

Course Outcomes

Upon completion of the course the student should be able to:

- CO 1 - design a concrete mix using IS code
- CO 2 - perform non destructive and durability tests and predict the strength of concrete
- CO 3 - Explain the behavior of beams and columns under flexure and shear
- CO 4 - Ability to install strain gauges on steel structural components and systems and collect data from strain gauges
- CO 5 - Ability to perform column buckling tests
