**VALUE ADDED PROGRAMME**  
**COURSE CONTENT**

**1. SURGICALLY ASSISTED ORTHODONTIC TOOTH MOVEMENT**

The development of surgically-assisted orthodontic treatment opened doors and offered solutions to many limitations in the orthodontic treatment especially for adults. Advantages include a reduced treatment time, enhanced expansion, differential tooth movement, increased traction of impacted teeth and, finally, more post-orthodontic stability.

**2. CURRENT TRENDS IN DIAGNOSIS**

Every medical, dental and surgical procedure is solely based on the diagnosis of the underlying pathology or disorder. Recent advances in diagnostic aids address a special aspect of orthodontic diagnosis and treatment planning that has become increasingly, important in our litigious society. Though orthodontic diagnosis seems to be a well versed part for all of us, yet there are very many current trends which we are unaware of, rather we hardly practise newer trends with respect to diagnostic aids.

**3. BRACKET PRESCRIPTION IN ORTHODONTICS**

“There is only one disease – malocclusion. The medicine is force, and there are a number of ways to apply that force” - Weinstein Handles of force delivery

Orthodontic brackets- The system which forms the main skeletal framework of our day today treatment plan for patients. Bracket prescriptions have evolved over a period of years greatly, yet we fail to understand the minute aspects associated with those brackets which we do not use regularly.

**4. BONE AUGMENTATION IN ACCELERATED OSTEOGENIC ORTHODONTICS**

Demineralization of a thin layer of bone over a root prominence after corticotomy surgery can optimize the response to applied orthodontic forces. This physiologic response is consistent with the regional acceleratory phenomenon process. When combined with alveolar augmentation, one is no longer strictly at the mercy of the original alveolar volume and osseous dehiscences, and fenestrations can be corrected over vital root surfaces. This is substantiated with computerized tomographic and histologic evaluations

**5. MANAGEMENT OF TRANSVERSE DISCREPANCY**

Transverse discrepancies warrant special consideration in orthodontic diagnosis and treatment planning. Determination of the underlying cause of the asymmetric or symmetric transverse problem must be an important ingredient in the process of formulation of an appropriate treatment plan. Depending upon the structures involved, these problems may be primarily dental, skeletal, and functional in origin or may even have combination of these factors present. It is equally important to determine the relationship of the transverse discrepancy with the sagittal and vertical problems, which often have a significant impact on designing a treatment strategy. The management of transverse discrepancies has been universally recognized as one of the most challenging aspects of orthodontic therapy.

## **6. TADS PRINCIPLES AND PROCEDURES**

Although TADs have been in existence for more than 35 years, it is only within the past decade that their use has become commonplace among orthodontic practitioners the use of TADs has made orthodontic anchorage less reliant upon patient cooperation. While they do not necessarily increase the rate of orthodontic correction, they allow clinicians to achieve better and more predictable outcomes. For these reasons, TADs will continue to be a part of the regimen of contemporary orthodontic practice.

## **7. CURRENT TRENDS IN ORTHODONTIC BONDING**

Continuous search is on for higher bond strengths, better adhesives and materials that will bond in presence of saliva. There is a need to improve the bonding procedure to maintain clinically useful bond strengths while minimizing the amount of enamel loss and to simplify the technique reducing the number of steps

In the past decade, one has witnessed unprecedented progress in bonding to enamel with various materials techniques and auxiliaries involving glass ionomer bonding, self-etching primers, and new, powerful light-curing sources, along with self-ligating brackets and a different treatment concept, the Invisalign technique.

## **8. LINGUAL ORTHODONTICS**

Adult patients present with a unique challenge of wanting to look good even during orthodontic treatment. They have demands of their work and broader social needs to consider. They think that braces are normally meant for kids. In an effort to provide solutions to these esthetic problems tooth colored brackets and wires were also introduced. But these brackets were invisible only from a distance. Some orthodontist thought of placing braces on the lingual side, leaving the labial surface untouched. Thus was born the methodology of lingual orthodontics

## **9. ENVISAGE- THE THIRD DIMENSION IN ORTHODONTIC DIAGNOSIS**

Conventional two dimensional lateral and postero-anterior cephalogram were still the common attribute in right diagnosis and treatment planning of the skeletal and dental malocclusion in orthodontic patients. Though various analyses have been employed in analysing the severity of

the underlying craniofacial deformity, it possesses few drawbacks such as superimposition artifacts and difficulty in landmarks identification.

To overcome these deficiencies, recently three-dimensional Cone beam computed tomography (CBCT) has evolved offering better visualization of the deformity aiding accurate diagnosis and virtual treatment planning. Computer assisted Orthognathic Surgical planning is the contemporary approach in 3D structural analysis of the hard and soft tissues of the face which offers multiple advantages when preparing for and evaluating the results of an orthognathic surgery patient.

#### **10.CURRENT TRENDS IN SURGICAL ORTHODONTICS**

Our ability to predict the future is no more accurate than other knowledgeable clinicians, but current trends do offer probable outcomes for at least the next decade and perhaps longer.

# Basic Life Support

The circulation and ventilation until action can be taken to reverse the underlying cause of the cardio and respiratory arrest. Failure of circulation for 3-4 minutes (less if the patient is hypoxemic initially) will lead to irreversible

Resuscitation) also enhances the circulation to the brain so CPR is better termed CPR (Cardio Pulmonary Cerebral Resuscitation). Any delay in starting BLS will reduce the chances of a successful outcome. The chances of survival are much greater in Early recognition of sudden cardiac arrest, Early CPR, Early Defibrillation, Early Advance care and Post Resuscitation Care.

## History

Closed chest cardiac massage was described in 1878 by Boehm and applied successfully in a few cases of cardiac arrest over the next 10 years. In the late 1950s Peter Safar published his work on the efficacy of mouth-to-mouth ventilation, followed in 1960 by the classic paper by Kouwenhoven, Jude, and Knickerbocker describing closed chest cardiac massage. Modern cardiopulmonary resuscitation was therefore established in 1960 and the following year, Safar described his success in teaching CPR to the public.
