BONAFIDE CERTIFICATE

This is to certify that this Project Report is the bonafide work of **JEEVITHA D (38120033)** who carried out the project entitled **"MYSQL AND PHP Based Airline Ticket Reservation System"** under our supervision from Sept 2021 to Nov 2021.

INTERNAL GUIDE

Dr. Ajitha

HEAD OF THE DEPARTMENT

Dr. SUBHASHINI, M.E., Ph.D

Submitted for Viva voce Examination held on

Internal Examiner

External Examiner

DECLARATION

I **JEEVITHA D** hereby declare that the Project Report entitled "**MYSQL AND PHP Based Airline Ticket Reservation System**" done by me under the guidance of **Ms.Dr.Ajitha** is submitted in partial fulfillment of the requirements for the award of Bachelor of Technology degree in Information Technology.

DATE: 27/09/2021

PLACE: Chennai

SIGNATURE OF THE CANDIDATE

ACKNOWLEDGEMENT

I am pleased to acknowledge my sincere thanks to Board of Management of SATHYABAMA for their kind encouragement in doing this project and for completing it successfully. I am grateful to them.

I convey our thanks to **Dr. T. SASIKALA M.E., Ph.D.**, Dean, School of Computing and **Dr. R.SUBHASHINI, M.E.,Ph.D.**, Head of the Department, Department of Computer Science and Engineering for providing us the necessary support and details at the right time during the progressive reviews.

I would like to express my sincere and deep sense of gratitude to our Project Guide **Dr.Ajitha** for her valuable guidance, suggestions and constant encouragement paved way for the successful completion of my project work.

I wish to express my thanks to all Teaching and Non-teaching staff members of the Department of **INFORMATION TECHNOLOGY** who were helpful in many ways for the completion of the project

ABSTRACT

The project aims to design & implementation of an air ticket reservation system which will provide customers a facility to reserve there tickets without any hassle. It is a web based system & it will save valuable time and effort of air traveler. The air ticket reservation system designed in this project was developed using php, javaScript, css and html as the programming languages and Mysql as the database Management system. This system allows real time communication between admin and user. This system allows the passenger to cancel his/her reservation, if any problem occurs and view price chat which did not occur in the existing system. This system allows the airline passengers to search for flights that are available between the two travel cities, namely the “Departure city” and “Destination city” for a particular departure and arrival date. The system displays all the flight’s details such as flight number, name, price and duration of journey etc. After search the system display list of available flights and allows customer to choose a particular flight. Then the system checks for the availability of seats on the flight. Then it book the flight.

CHAPTER 1

INTRODUCTION

1.1 GENERAL

The Airline Reservations System (ARS) was one of the earliest changes to improve efficiency. ARS eventually evolved into the Computer Reservations System (CRS), and then into Global Distribution System (GDS). The airline industry created the first GDS in the 1960s as a way to keep track of flight schedules, availability, and prices. Although accused of being “dinosaurs” due to their use of legacy system technology, GDSs were actually among the first e-commerce companies in the world facilitating B-2-B electronic commerce as early as the mid 1970s, when SABRE (owned by American Airline) and Apollo (United) began installing their propriety internal reservations systems in travel agencies. Prior to this, travel agents spent an inordinate amount of time manually entering reservations. The airlines realized that by automating the reservation process for travel agents, they could make the travel agents more productive and essentially turn into

an extension of the airline's sales force. It is these original, legacy GDSs that today provide the backbone to the Internet travel distribution system.

1.2 OUTLINE OF THE PROJECT

The main purpose of this software is to reduce the manual errors involved in the airline reservation system process and make it convenient for the customers to book the flights as when they require such that can utilize this software to make reservation, modify reservations or cancel a particular reservation. The name of the software is "AIRLINE RESERVATION SYSTEM". This software provides options for viewing different flights available with different timings for a particular date and provides customers with the facility to book a ticket, modify reservation it provides the customers with details of cost of the ticket and but it does not allow the customer to modify a particular part of his reservation and he/she can't modify all his det

CHAPTER 2

AIM AND SCOPE

2.1 AIM

The main objective **To make air ticket reservation easier for passenger.** To save time and effort of potential air traveler . To reduce the hassle of the user.

2.2 PROBLEM STATEMENT

My project is about In 21st century the world has become a global village where every thing is available in a single click of mouse button. Aviation sector is one of fastest mode of travel available with us, both at domestic and international level. To maintain such a large system is a hectic job. The present system is very time consuming and inefficient.

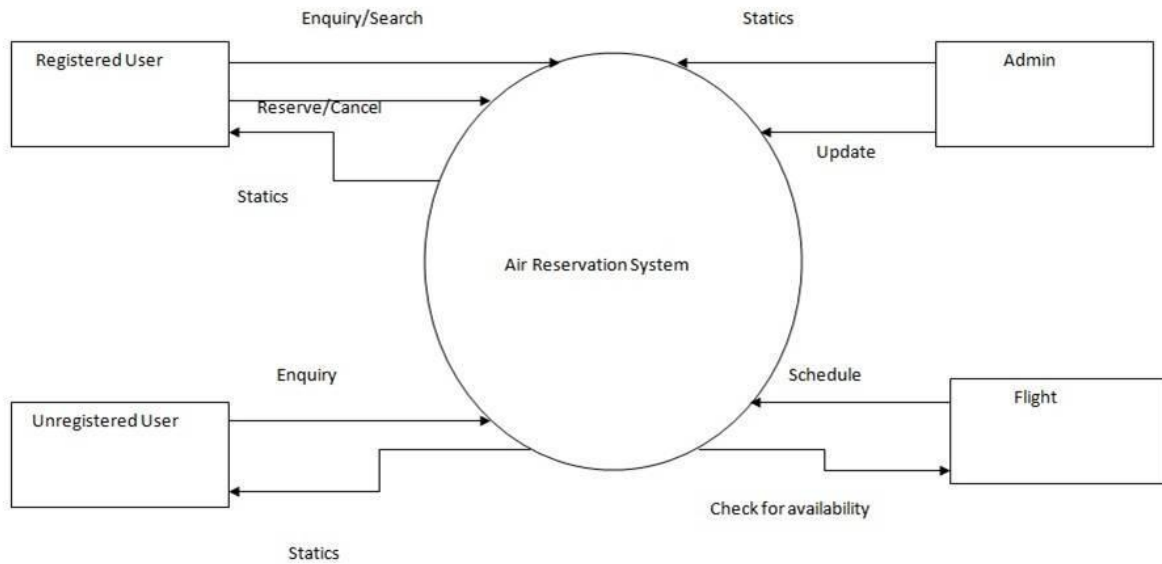

The definition of our problem lies in manual system and a fully automated system.

Manual system : The system is more prone to errors and some times it encounters various problems which are unstructured.

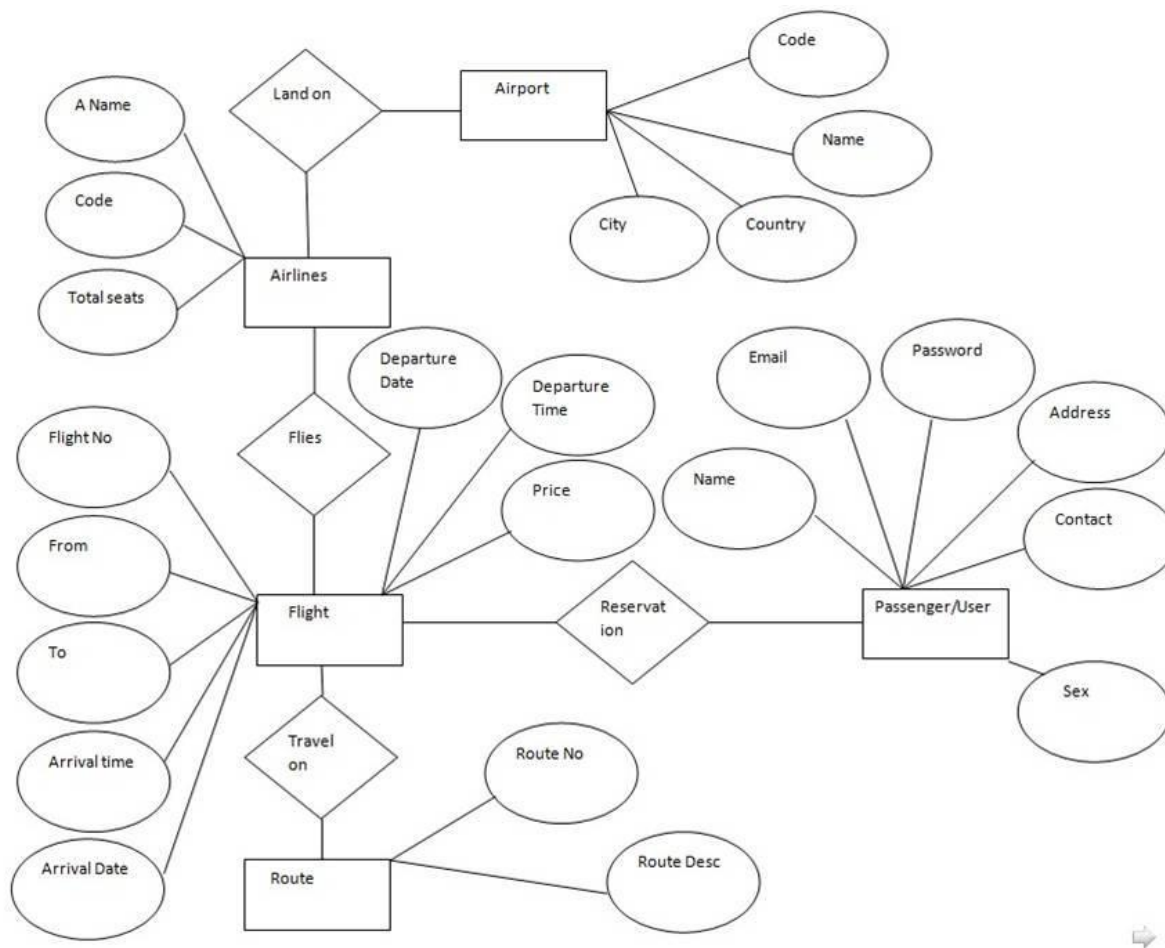

Technical system : With the advent of latest technology if we do not update our system then our business will suffer massive losses financially. The technical system (we have proposed) contains the tools of latest trend i.e. computers printers

ER DIAGRAM

USER CASE DIAGRAM

Use Case for air ticket reservation system :

2.4 SCOPE

The name of the software is "AIRLINE TICKET RESERVATION SYSTEM". This software provides options for viewing different flights available with different timings for a particular date and provides customers with the facility to book a ticket, modify or cancel a particular reservation but it does not provide the customers with details of cost a particular part of his reservation and he/she can modify all his details.

CHAPTER 3

ALGORITHMS AND METHODS

3.1 GENERAL

The project aims to design & implementation of an air ticket reservation system which will provide customers a facility to reserve there tickets without any hassle. It is a web based system & it will save valuable time and effort of air traveler. The air ticket reservation system designed in this project was developed using php, javaScript, css and html as the programming languages and Mysql as the database Management system. This system allows real time communication between admin and user. This system allows the passenger to cancel his/her reservation, if any problem occurs and view price chat which did not occur in the existing system. This system allows the airline passengers to search for flights that are available between the two travel cities, namely the “Departure city” and “Destination city” for a particular departure and arrival date. The system displays all the flight’s details such as flight number, name, price and duration of journey etc.

3.2 ALGORITHM

- ❖ Booking()
 - Ask user to enter number of passenger name, according the amount of seat number that enter ,store and display in the ticket()
 - Show the booking ID in seat number
- ❖ Void seat()
 - Show all the seats that have books with booking ID
 - How to display the booking ID in seats numbers
- ❖ Void records()

- Display all the records, ticket that user have enter

3.3 PROJECT DESCRIPTION

Airline reservation tickets systems are systems that allow an airline to sell their .It contains information on and fares and contains a database of reservation and of tickets issued.ARSs are part of passenger service systems,which are applications supporting the direct contact with the passenger.

3.4 SUMMARY

Airline reservation system(ARS) are systems that allow an airline to sell their inventory(seats).It contains information on schedules and fares and contains a database of reservations(or passenger name records) and of tickets issued(if application).ARSs are part of passenger service systems(PSS),which are applications supporting the direct contact with the passenger.

CHAPTER 4

SYSTEM IMPLEMENTATION

4.1 REQUIREMENTS

I.HARDWARE REQUIREMENTS:

Processor	:	Intel Pentium or more
Ram	:	128 MB or more
Cache	:	512 KB
Hard disk	:	16 GB hard disk recommended

II. SOFTWARE IMPLEMENTATION

Operating system	:	Windows 2000 or later
Front End	:	Visual Basic
Back End	:	SQL Server 2000

Relational Database: -

- Oracle,
- IBM DB2,
- SQL Server,
- MS Access and FoxPro etc.

Language

- HTML
- CSS
- JavaScript
- PHP
- MySQL

CHAPTER 5

CONCLUSION AND FUTURE WORK

5.1 CONCLUSION

The online air ticket reservation automates the process of booking airline tickets, thus reducing the time wasted as well as the errors that are involved in the manual process. We analyzed different Air Ticket Reservation System worldwide and tried to gather different features from them. We accumulated all the feature currently used by the Air Reservation System apart from some graphical enhancements. In this project we had to think about the various options which we can provide to user. We have tried to make this project user friendly and also interactive by providing many features. A lot of experimental

work can be done with this project. Looking forward for any advice which can help us to improve the project

5.2 FUTURE WORK

- ☐ Develop mobile app of this system.
- ☐ Introduce online payment system.
- ☐ Add mobile verification system.
- ☐ Introduce live chat between admin & user
